MASTER

APPLIED MATHEMATICS

The language of science and the study of practical problems.

Mathematics is one of the oldest fields of human intellectual endeavor. As technology emerges, mathematicians are increasingly involved in practical problem solving.

When studying abstract concepts, applied and pure mathematics are strongly linked. Significant breakthroughs in physical and computational sciences, as well as the data revolution have given rise to a plethora of challenges in the field of applied mathematics. Its applications are varied: statistics for finance and environmental sciences; powerful data compression algorithms for communication systems; simulation of blood flow using numerical methods.

The master in Applied Mathematics provides students with all the advanced skills needed in various fields, such as Statistics, Probability or Scientific Computing.

Cardiovascular simulations

Prof. Deparis

A better understanding of vascular flow is of crucial importance to better assess the risks associated to a specific pathology. Thanks to numerical simulation it is possible to provide flow indices which may help in the decision making for

presence of an

Abdominal Aortic

(AAA), the surgeon has to

decide upon intervention.

Aneurism

Cappelletti:
"I chose
(athematics as I For exemple, in

Mathematics as I
felt it is part of many
aspects of our life. I
wanted to know more about
it, as I think in this increasingly

William

connected world, having a strong knowledge in Statistics and

Algorithms can open many doors.
That's why I am satisfied with
my master, not to mention that it
gives me the chance to study with

gives me the chance to study with amazing people in a stimulating environment."

The images shows the drop in presence of an AAA and after surgical intervention with EndoVascular Aneurysm Sealing (EVAS) [Colciago, Deglise, Deparis, Dubuis 2019].

Access to patient specific numerical simulations allows to better evaluate the opportunity of an intervention.

From the modeling point of view, the blood flow is described by the Navier-Stokes equations and the arterial wall by specific non-linear elastic laws. The finite element method is a perfect tool to correctly approximate the vascular flows. Mathematics

is important to ensure the coupling between fluid and structure, but also to control the accuracy of the simulation. Since the non-linear system involves a huge number of unknowns, it is also necessary to devise parallel algorithms for its resolution.

Extreme wind storms

Prof. Davison

Often the risk for human infrastructure or insurance portfolios due to extreme windstorms is based on catalogues of events that are used as `stress tests'. These catalogues usually consist of historical records or are artificially generated by climate models, and can have severe limitations when estimating the risk of events even more severe than those previously seen.

Stochastic weather generators are mathematical models that create random but realistic events which could be used to enlarge or even create catalogues. Extreme value theory describes the statistical behavior of extreme events and provides a mathematical framework to extrapolate above the intensity of historical records. These approaches have been used to develop a generator of extreme European wind storms that can simulate events of unprecedented severity, such as the one shown below.

The new methods can be used to understand the impact of climate change on extreme events and thus help to assess the exposure of current infrastructure.

extreme events and thus help to assess the exposure of current infrastructure to climatological risk, as well as helping to plan for the future.

lon

Anne-Sophie Van de Velde:
"What I love in mathematics is the rigor
found in reasoning. Studies in mathematics
enable to develop a critical spirit and to
visualize quickly what is superfluous in a proof.
In my minor in informatics, I see real-life
applications of theoretical concepts
that are explained in my
mathematical courses.
That is fascinating!"

Master of Science in

APPLIED MATHEMATICS

2-year program - 120 ECTS

Students must choose at least 30 ECTS worth of courses labelled A.

Optional courses are classified in the following tracks:

- · Algebra and geometry
- · Algorithmic and discrete mathematics
- Analysis
- · Numerical analysis
- Probability and interactions
- Statistics

On top of the Optional courses (40 ECTS) students must choose 4 ECTS in another engineering program, except if they opt for a 30 ECTS engineering minor.

Recommended courses:

- Applied biomedical signal processing
- Signal processing for communications
- Statistical signal and data processing through applications
- Applied data analysis
- Algorithms
- · Advanced algorithms
- · Information theory and coding
- Investments
- · Quantitative risk management
- Principles of microeconomics
- Relativity and cosmology I
- Relativity and cosmology II

Students opting for a minor in engineering may shorten their industrial internship.

		Credits
Optional courses	Α	40
Algebra and geometry		
Analysis on groups		5 5
Analysis on groups Complex manifolds		5
Ergodic theory		5
Homotopical algebra		5
Homotopy theory Introduction à la géométrie riemannienne		5 5
Introduction to general relativity		5
Lie groups		5
Linear algebraic groups		5
Modern algebraic geometry Modular forms and applications		10 5
Number theory in cryptography		5
Representation theory of semisimple lie algebras		5
Riemann surfaces Tanica in algebraic geometry		5
Topics in algebraic geometry Topics in arithmetic geometry		5 5
Topics in calculus of variations		5
Topics in number theory		5
Algorithmic and discrete mathematics	Λ	E
Inference on graphs Integer optimisation	A A	5 5
Mathematical modeling of behavior	A	5
Metric embeddings		5
Optimisation on manifolds	A A	5 5
Probabilistic methods in combinatorics Analysis	A	5
Calculus of variations		5
Differential geometry of framed curves	Α	5
Dispersive PDEs		5
Distribution and interpolation spaces Harmonic analysis		5 5
Mathematical modeling of DNA	Α	5
Nonlinear Schrödinger equations		5
Optimal transport	۸	5 5
Spectral theory	Α	
Topics in calculus of variations		
Topics in calculus of variations Numerical analysis		5
