

PhD position in the Laboratory of Synaptic Mechanisms / Project on fear learning

Our lab investigates the synaptic- and circuit mechanisms of fear learning in mice, with a focus on how auditory stimuli acquire negative emotional valence and ultimately instruct defensive behaviors. For this, we use state-of-the art *in-vivo* optogenetic methods, *in-vivo* electrophysiology and imaging of neuronal activity, as well as anatomical- and functional investigations of long-range synaptic connections.

The Schneggenburger lab has a PhD opening, in a project investigating auditory processing in the amygdala, and the plasticity mechanisms at defined synaptic inputs to the amygdala. The ideal candidate will have a Master's degree in Biology, Engineering. Medicine. **Physics** or Prior expertise in techniques electrophysiology, optogenetics and mouse behavior would be advantageous. He/she should be self-motivated and keen on learning and developing novel techniques, as well as on working in a team. The PhD candidate will enrol in the EPFL PhD program Neuroscience (next deadline, April 15th 2021; see https://www.epfl.ch/education/phd/edne-neuroscience/). For more information on this PhD position and project, please contact Prof. Ralf Schneggenburger (ralf. schneggenburger@epfl.ch).
