Convergence of Coalescing Nonsimple Random Walks to the Brownian Web.

Résumé

The Brownian Web (BW) is a family of coalescing Brownian motions starting from every point in space and time $\mathbf{R} \times \mathbf{R}$. It was first introduced by Arratia, and later analyzed in detail by Tölk and Werner. More recently, Fontes, Isopi, Newman and Ravishankar gave a characterization of the BW, and general convergence criteria allowing either crossing or noncrossing paths. For the noncrossing paths case, the convergence has been verified for coalescing simple random walks (FINR) and a two dimensional PoissonTree (Fontes, Ferrari, Wu). In this work, we establish the convergence of general coalescing random walks to the Brownian web, which is the first model with crossing paths that has been shown to converge to the Brownian web. Some implications for voter models will be discussed.
