

PROJECTS AT SOIS: MATERIALS FOR SPINTRONICS APPLICATIONS

Hugo Dil

Spin-Orbit Interaction Spectroscopy (SOIS)

Institute of Physics, Ecole Polytechnique Fédérale de Lausanne

Swiss Light Source, Paul Scherrer Institut

Novel electronics design to use the spin of the electron and not the charge

Main advantage: No movement of charge necessary

- Lower power consumption
- Faster
- Smaller
- Flexibility (not only 0 or 1)
- Spin is quantum state: quantum computing

Common approach based on magnetics

Giant Magneto Resistance (GMR):
Nobel prize 2007
Albert Fert, Peter Grünberg

Spintronics without magnetism

David Awschalom

Department of Physics, University of California, Santa Barbara, CA 93106, USA

Nitin Samarth

Department of Physics, The Pennsylvania State University, University Park, PA 16802, USA

Published June 15, 2009

The spin-orbit effect is at the heart of efforts to merge spintronics—where information is carried and stored by spin, rather than by charge—with semiconductor technology.

Spintronics without magnetism?

J. Hugo Dil

*Physik-Institut, Universität Zürich, 8057 Zürich, and Swiss Light Source, Paul Scherrer Institute, 5232 Villigen PSI
jan-hugo.dil@psi.ch*

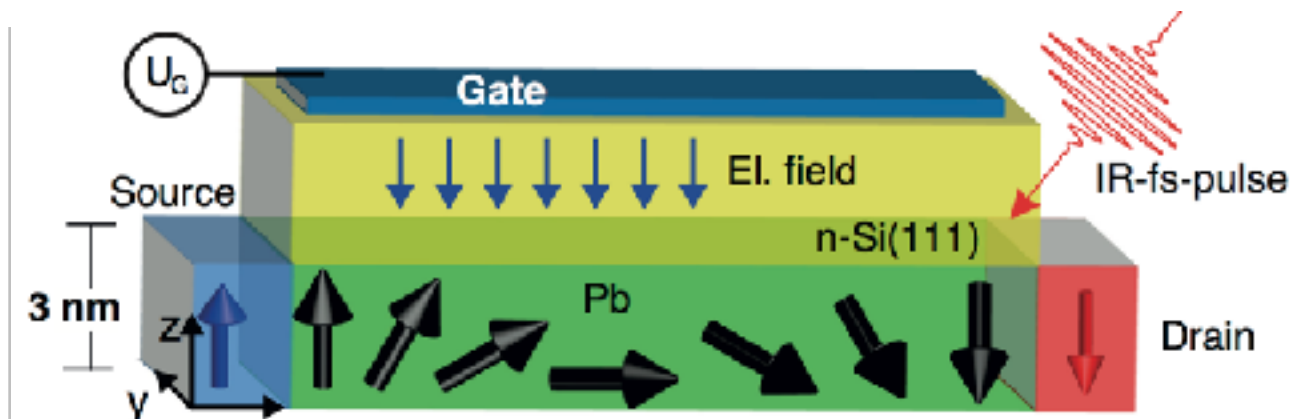

Magnetic fields are non-local and slow

Spin-orbit interaction is local and instantaneous

Magnetics

Spin-orbit interaction

Transistor

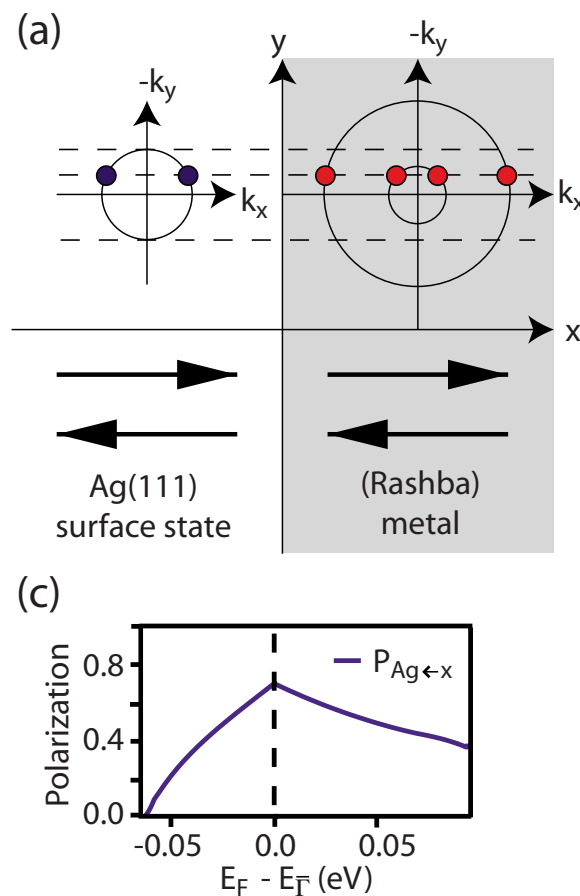

Novel materials needed!
Rashba systems and topological materials

Scientific Reports (2013)

writing

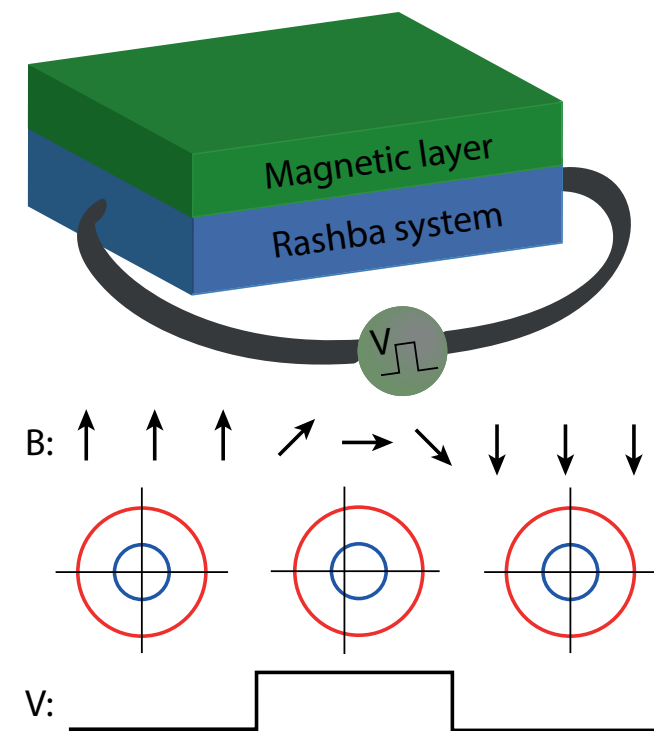

Spin injection

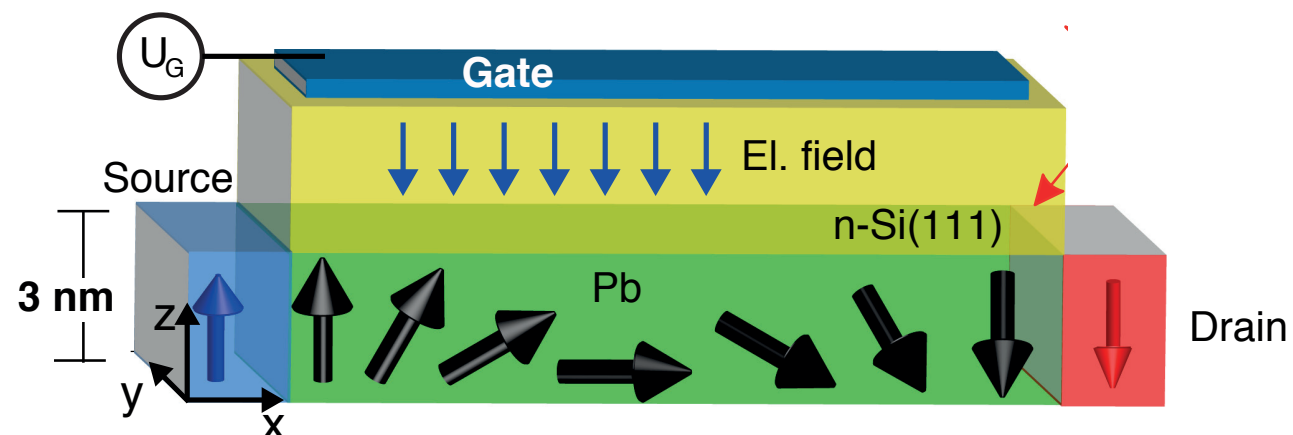

Spin \leftrightarrow charge conversion

Spin torque: Magnetic writing by small voltage pulse

Spin manipulation

Majorana fermions

Einstein's Photoelectric Equation

The electron leaves
the body with energy

$$\frac{1}{2}mv^2 = h\nu - P,$$

where h is Planck's constant,
 ν is the light frequency and
 P is the work the electron
has to do in leaving the body.

Albert Einstein, 1905

Typical ARPES set-up at synchrotron

ARPES: angle-resolved photoemission spectroscopy

Watching how electrons move and spin

Embedded in larger unit
(5 senior scientists, ~6 post docs, ~4 PhD students, 3 technicians)

2 beamlines

4 end stations:

- Spin-resolved ARPES (COPHEE)
- High-resolution ARPES
- Soft X-ray ARPES
- Resonant inelastic X-ray scattering

Many other collaborations and possibilities

Typical Master projects:

- Study (spin-resolved) electronic structure of novel spintronic materials
- Study change of electronic/spin structure under *operando* conditions
- Develop and test new measurement possibilities (sample environment)

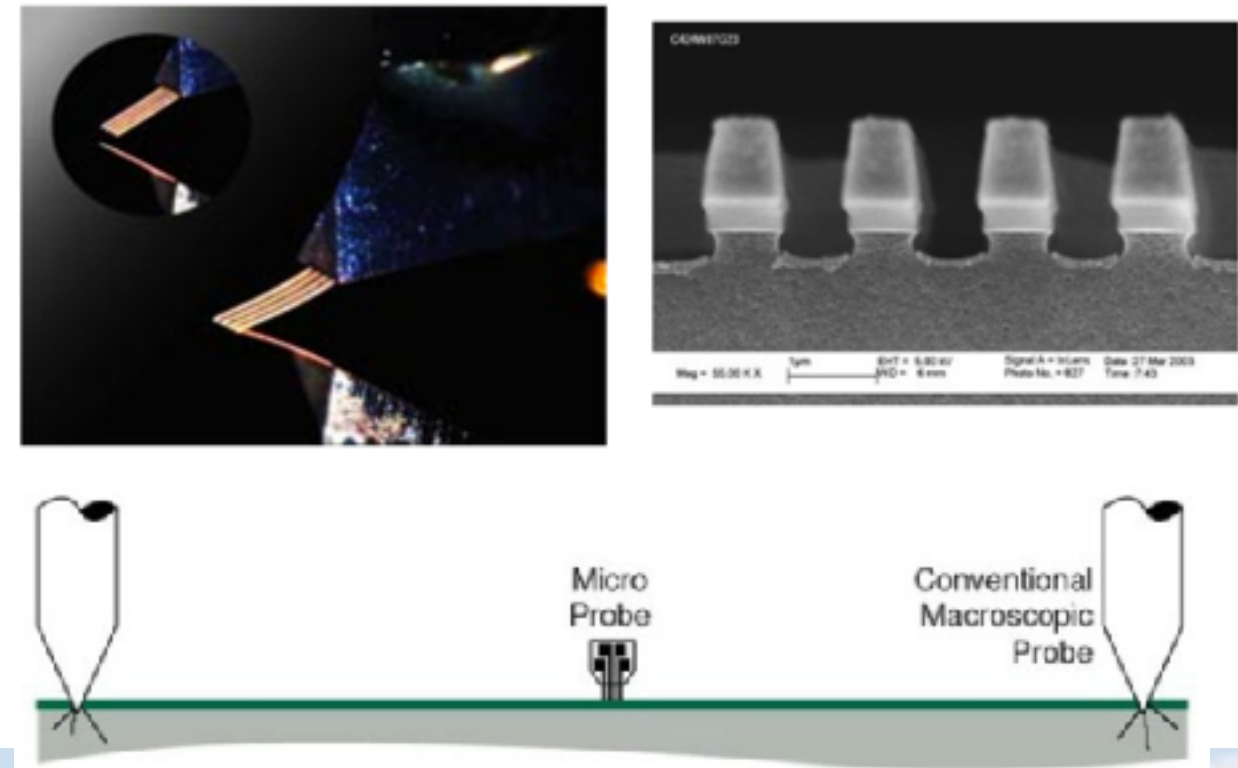

*The proof of the pudding
is in the eating*

Unit side view

Micro 4 point probe (M4PP)

Master projects:

- Setting and testing up novel M4PP equipment
- Combined M4PP and ARPES experiments
