Title: How Natural Language Processing (NLP) is Transforming Finance

Abstract: In many areas of finance a lot of manual research and document processing take place: research and due diligence for M&A in investment banking, the many investor reports, market information for trading as well as the analysts, cognitive enterprise search, processing of contracts and search for clauses and regulations and many more. For gaining a competitive advantage, automated and real-time information and processing is required. I will show examples of applications of NLP and how it transforms finance.
