Descriptif du projet

Enoil Bioenergies SA is a Swiss biotechnology and renewable energy company, headquartered in Geneva. The main areas of business are the production of renewable energy, development of biotechnology specifically on raw materials for the renewable energy, food, pharma and cosmetics industries.

Enoil Bioenergies is developing solar greenhouses for the farming of microalgae, spirulina, Chlorella and Astaxantina. An important factor in growth of microalgae is temperature. Maintaining photobioreactors or the production hall at the desired temperature (around 30 °C), requires a heating source. For our new production line of Spirulina, it is important to evaluate all the possible heating sources with least impact on the environment.

Objectif et buts

Considering the location (canton VD, VS) of production line, what heating sources are existing?

- Biogas from waste water treatment plant or farm waste
- Geothermal
- Wind
- Solar panels (geometry of the building will be provided)

What could be the optimal choice? Considering environmental impact, cost and availability.

Descriptif tâches

(Décrire 3 à 4 étapes de la démarche de projet en spécifiant s'il y a une partie expérimentale (terrain, mesures, prototypage)

- Collect necessary information which are needed to tackle the questions
- Assess the different options and pathways according to the goals of ENOIL BIOENERGIES
