## Review Session

## Problem 1: Review of Random Variables

Let X and Y be discrete random variables defined on some probability space with a joint pmf  $p_{XY}(x,y)$ . Let  $a,b \in \mathbb{R}$  be fixed.

- (a) Prove that  $\mathbb{E}[aX + bY] = a\mathbb{E}[X] + b\mathbb{E}[Y]$ . Do not assume independence.
- (b) Prove that if X and Y are independent random variables, then  $\mathbb{E}[X \cdot Y] = \mathbb{E}[X] \cdot \mathbb{E}[Y]$ .
- (c) Assume that X and Y are not independent. Find an example where  $\mathbb{E}[X \cdot Y] \neq \mathbb{E}[X] \cdot \mathbb{E}[Y]$ , and another example where  $\mathbb{E}[X \cdot Y] = \mathbb{E}[X] \cdot \mathbb{E}[Y]$ .
- (d) Prove that if X and Y are independent, then they are also uncorrelated, i.e.,

$$Cov(X,Y) := \mathbb{E}\left[ (X - \mathbb{E}[X])(Y - \mathbb{E}[Y]) \right] = 0. \tag{1}$$

- (e) Find an example where X and Y are uncorrelated but dependent.
- (f) Assume that X and Y are uncorrelated and let  $\sigma_X^2$  and  $\sigma_Y^2$  be the variances of X and Y, respectively. Find the variance of aX + bY and express it in terms of  $\sigma_X^2, \sigma_Y^2, a, b$ . **Hint:** First show that  $Cov(X,Y) = \mathbb{E}[X \cdot Y] - \mathbb{E}[X] \cdot \mathbb{E}[Y]$ .

## Problem 2: Review of Gaussian Random Variables

A random variable X with probability density function

$$p_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-m)^2}{2\sigma^2}}$$
 (2)

is called a *Gaussian* random variable.

- (a) Explicitly calculate the mean  $\mathbb{E}[X]$ , the second moment  $\mathbb{E}[X^2]$ , and the variance Var[X] of the random variable X.
- (b) Let us now consider events of the following kind:

$$\mathbb{P}(X < \alpha). \tag{3}$$

Unfortunately for Gaussian random variables this cannot be calculated in closed form. Instead, we will rewrite it in terms of the standard Q-function:

$$Q(x) = \int_{x}^{\infty} \frac{1}{\sqrt{2\pi}} e^{-\frac{u^{2}}{2}} du \tag{4}$$

Express  $\mathbb{P}(X < \alpha)$  in terms of the Q-function and the parameters m and  $\sigma^2$  of the Gaussian pdf.

Like we said, the Q-function cannot be calculated in closed form. Therefore, it is important to have bounds on the Q-function. In the next 3 subproblems, you derive the most important of these bounds, learning some very general and powerful tools along the way:

(c) Derive the Markov inequality, which says that for any non-negative random variable X and positive a, we have

$$\mathbb{P}(X \ge a) \le \frac{\mathbb{E}[X]}{a}.$$
 (5)

(d) Use the Markov inequality to derive the Chernoff bound: the probability that a real random variable Z exceeds b is given by

$$\mathbb{P}(Z \ge b) \le \mathbb{E}\left[e^{s(Z-b)}\right], \qquad s \ge 0. \tag{6}$$

(e) Use the Chernoff bound to show that

$$Q(x) \le e^{-\frac{x^2}{2}} \quad \text{for } x \ge 0. \tag{7}$$

## Problem 3: Moment Generating Function

Let X be a real-valued random variable taking values on a finite set. The logarithmic moment generating function is defined as follows.

$$\phi(s) := \ln E[\exp(sX)] = \ln \sum_{x} p(x) \exp(sx)$$

- (a) Show that  $p_s(x) := p(x) \exp(sx) \exp(-\phi(s))$  is a probability mass function.
- (b) Let  $X_s$  be a random variable taking the same value as X but with probabilities  $p_s(x)$ , show that  $\phi'(s) = E[X_s]$ .
- (c) Show that

$$\phi''(s) = \text{Var}(X_s) := E[X_s^2] - E[X_s]^2$$

and conclude that  $\phi''(s) \geq 0$  and the inequality is strict except when X is deterministic.

(d) Let  $x_{\min} := \min\{x : p(x) > 0\}$  and  $x_{\max} := \max\{x : p(x) > 0\}$  be the smallest and largest values X takes. Show that

$$\lim_{s \to -\infty} \phi'(s) = x_{\min}, \quad \text{and} \quad \lim_{s \to \infty} \phi'(s) = x_{\max}.$$
