

PHYS-476

Advanced superconducting magnet technologies

Riccioli Rebecca

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Physicien	MA2, MA4	Opt.

Language of teaching	English
Credits	4
Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

The course will focus on the technologies related to the practical use of superconductors, from the manufacturing to their exploitation. The course also provides some examples of the use of superconductivity for relevant applications and the main technological challenges related to each of them.

Content***Theoretical part***

Introduction to industrial superconductors
 Fundamental Principles of Superconducting Magnets
 Coil design and manufacturing (Lecture on cables by Dr. Kamil Sedlak)
 Cooling techniques and thermal management
 Superconducting magnet applications:

- Accelerators
- Medical applications
- Nuclear fusion (Lecture by Dr. Kamil Sedlak)
- Motors

Field quality measurements (Lecture by Dr. Giuseppe Montenero)

Exercises and laboratories

Practical exercises on 0D/2D design of magnets for different applications and laboratory activities complement the theoretical part.

Keywords

Superconductivity
 Magnets
 Field quality

Learning Prerequisites**Required courses**

Advanced physics II PHYS-105
 Physics lab (metrology) PHYS-117
 Classical electrodynamics PHYS-324
 Solid state physics PHYS-337

Recommended courses

Solid state physics III PHYS-419
 Solid state physics IV PHYS-420
 Fundamentals of biomedical imaging PHYS-438
 Nuclear fusion and plasma physics PHYS-445
 Introduction to particle accelerators PHYS-448
 MRI practicals on CIBM preclinical imaging systems PHYS-473

Learning Outcomes

By the end of the course, the student must be able to:

- Design electromagnetically simple magnet geometries
- Define the working points of the superconductor based on the application
- Formulate the critical aspects of a superconducting magnet
- Expound the main aspects of superconducting magnets for different applications
- Describe the different systems to characterize the magnet quality

Transversal skills

- Demonstrate the capacity for critical thinking
- Use both general and domain specific IT resources and tools
- Write a scientific or technical report.

Teaching methods

Lecture based teaching using slides and blackboard.

Assessment methods

The exam is based on an oral assessment during the exam session. Before the oral exam, students will be asked to write a short report describing the laboratory activities completed, which will contribute 10% of the final grade.

Supervision

Office hours	Yes
Assistants	No
Forum	No
Others	The office hours will take place via zoom. In order to have a discussion with the teacher send an email with the convenient time and dates for the students.

Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course provides the essential concepts for understanding how stars form, evolve, radiate, and synthesize their chemical elements. These are fundamentals to tackle the variety of galaxy properties, and how their interstellar medium is gradually enriched with metals.

Content

The course is based on 6 connected parts:

1. - Stellar evolution and nucleosynthesis: The energetics for the fusion of the different chemical elements.
2. - Galaxy star formation history and chemical evolution: How can one infer them?
3. - General information on radiation: intensities, fluxes, and radiation pressure. Temperatures in astrophysics, extinction and emission coefficients.
4. - Stellar atmospheres: the radiative transfer equation, outgoing flux. The different modes of energy transfer.
5. - Radiation-matter interaction in stellar interiors: Boltzmann's and Saha's laws; absorption, opacities, spontaneous emission, induced emission, the Einstein coefficients. Spectral lines; curve of growth: how can one derive the metal content of stars?
6. - Thermodynamics and internal structure of stars: perfect and degenerate gas: the different ways stars explode.

At the end of the semester, the students will be familiar with the physics governing the different stellar evolutionary stages and their contribution to the galaxy spectral energy distributions. They will be able to interpret spectral features, the galaxy chemical patterns, and infer the length and efficiency of the galaxy star forming activities.

Keywords

- astrophysics
- energy transport
- nucleosynthesis
- stellar evolution
- galaxy evolution

Learning Prerequisites**Required courses**

There is no mandatory course but

- Astro I is recommended

- Knowledge in thermodynamics, statistical and quantum physics is recommended
- Basic knowledge in python is recommended

Assessment methods

Written form

Summary

Galaxy formation & evolution is about studying how galaxies in our Universe come into existence, how they evolve and what shapes their properties. This course describes the observational facts of galaxies and the various processes of galaxy evolution as seen from theoretical/numerical models.

Content

- *Lecture 1 (Repetition of Astro-I and Astro-II):*
 - Introduction (galaxy definition, astronomical scales, observable quantities)
 - Brief review on stars
- *Lecture 2:*
 - Radiation processes in galaxies and telescopes;
 - The Milky Way
- *Lecture 3:* The world of galaxies I
- *Lecture 4:*
 - The world of galaxies II;
 - Black holes and active galactic nuclei
- *Lecture 5:*
 - Galaxies and their environment;
 - High-redshift galaxies
- *Lecture 6:*
 - Cosmology in a nutshell
 - Linear structure formation in the early Universe
- *Lecture 7:*
 - Dark matter and the large-scale structure
 - Cosmological N-body simulations of dark matter
- *Lecture 8:* Populating dark matter halos with baryons:

- Semi-empirical models
- Semi-analytical models
- *Lecture 9*: Modelling the evolution of gas in galaxies: Hydrodynamics
- *Lecture 10*:
 - Gas cooling/heating
 - Star formation
- *Lecture 11*: Stellar feedback processes
- *Lecture 12*: Black hole growth and AGN feedback
- *Lecture 13*: Success and challenges of modern simulations
- *Lecture 14*: Future prospects and mock exam

Keywords

Astrophysics, Galaxies formation and evolution, Observations, Theoretical/numerical models of galaxies

Learning Prerequisites

Recommended courses

- Bachelor in physics or mathematics
- Astrophysics I, II (but there will be some revision)
- Basics in Python programming

Learning Outcomes

By the end of the course, the student must be able to:

- Theorize fundamental principles of galaxy formation and evolution
- Interpret observational results of galaxies
- Analyze observational data and theoretical/numerical simulations

Transversal skills

- Access and evaluate appropriate sources of information.

Teaching methods

Ex cathedra and exercices supervised in classroom.

Assessment methods

oral exam (100%).

Number of positions	

Summary

The aim of this course is to acquire the basic knowledge on specific dynamical phenomena related to the origin, equilibrium, and evolution of star clusters, galaxies, and galaxy clusters.

Content

1. Introduction: distances, sizes, masses of stellar dynamics systems such as star and galaxy clusters
2. Potential theory
3. Stellar Orbits
4. Equilibria of collisionless systems
5. Stability of collisionless systems
6. Disk dynamics and the formation of spiral structures

Learning Prerequisites**Recommended courses**

Bachelor in physics or mathematics and Astrophysics I and II

Learning Outcomes

By the end of the course, the student must be able to:

- Theorize the laws of stellar dynamics

Transversal skills

- Access and evaluate appropriate sources of information.

Teaching methods

Ex cathedra and exercises supervised in classroom

Assessment methods

oral exam (100%)

Summary

Cosmology is the study of the structure and evolution of the universe as a whole. This course describes the principal themes of cosmology, as seen from the point of view of observations.

Content

1. A brief historical perspective: a few ancient cosmologies. Olbers' paradox.
2. The three observational pillars of Big Bang cosmology discovered during the 20th century: (i) The universe expansion; (ii) The cosmic microwave background at 3K; (iii) The abundance of light elements.
3. The metric of the universe. The spectral redshifts.
4. Cosmological models and the evolution of the universe.
5. Observational tests: the age of the universe, mean density and the problem of dark matter, nucleo-cosmo-chronology, the deep galaxy counts.
6. Recent observations of the cosmic microwave background and its power spectrum.
7. Impact of gravitational lenses on cosmology.
8. The initial phases of the evolution of the universe in the Big Bang model and cosmological nucleosynthesis.

Learning Prerequisites**Recommended courses**

Bachelor in physics or mathematics and Astrophysics I, II and III

Learning Outcomes

By the end of the course, the student must be able to:

- Theorize the fundamental principles of cosmology

Transversal skills

- Access and evaluate appropriate sources of information.

Teaching methods

Ex cathedra and exercices supervised in classroom

Remark

Next time: Fall

Summary

This course describes the principles of attosecond photons and electron pulses generation

Content

Introduction to laser physics
 Introduction to short pulses generation
 High Harmonic generation and attosecond photon sources
 Free electron lasers principles and operation
 Ultrafast electron sources, principles and implementation
 Attosecond electron sources
 Exotic radiation sources, gamma ray lasers, atomic laser

Keywords

Femtosecond, Attosecond, Zeptosecond, Ultrafast, lasers, electrons

Learning Prerequisites**Required courses**

Basic principles of electromagnetism and quantum mechanics

Recommended courses

Electromagnetism
 quantum mechanics

Important concepts to start the course

Maxwell's equations
 Basic principles of optics

Learning Outcomes

By the end of the course, the student must be able to:

- Describe Ultrafast laser sources

- Design An ultrafast laser
- Describe Free electron lasers
- Describe Pulsed electron sources
- Design Attosecond electron beam
- Operate Ultrafast laser
- Operate Femtosecond electron beam line

Teaching methods

The course will be taught ex cathedra and with several lab-based practical trainings

Expected student activities

participation to laboratory activity during the exercise sessions

Assessment methods

Oral

Summary

Understand and use the results and methods of population genetics, population dynamics, network theory, and reaction network dynamics to analyze and predict the behavior of living systems

Learning Outcomes

By the end of the course, the student must be able to:

- Analyze biological dynamics
- Solve the Master equation in different contexts
- Formulate dynamical equations describing biological systems

Teaching methods

Flipped classroom, lectures (online and in person), in-person discussions, discussions of research articles, problem solving

Expected student activities

attend lectures, watch online lectures, complete exercises, read and present recent papers in the field

Assessment methods

40% homework, 60% final project

Number of positions	

Summary

The numerical simulation of quantum systems plays a central role in modern physics. This course gives an introduction to key simulation approaches, through lectures and practical programming exercises. Simulation methods based both on classical and quantum computers will be presented.

Content

- 1. Single-particle Problems:** Numerical solutions of the Schroedinger equation, Numerov's integration, the split operator method
- 2. Quantum Spin Models:** Choice and representations of basis sets for the many-body problem, the Trotter decomposition for real and imaginary-time evolution
- 3. Electronic Structure:** Second Quantization, Full Configuration Interaction, Hartree-Fock, Density Functional Theory
- 4. Variational Methods:** Variational Monte Carlo. Machine Learning Based Techniques, Time-dependent Variational Approaches
- 5. Quantum Monte Carlo Methods:** Path Integral Monte Carlo at finite and zero temperature
- 6. Quantum Computing:** Quantum simulation on a quantum computer, Adiabatic State preparation, Variational Quantum Eigensolver

Keywords

Quantum simulation, Variational Monte Carlo, Machine Learning in Physics, Density Functional Theory, Lanczos, Path Integral Monte Carlo, Quantum Computing, Second Quantization, Time-Dependent Variational Principle

Learning Prerequisites**Required courses**

A solid understanding of quantum mechanics (I and II) is required.

Students should have a good working knowledge of at least one common programming language (Python, C, C++, Fortran, Julia...). It is strongly advised to be familiar with Python, since the exercises will be typically presented and discussed in Python.

Recommended courses

-

Learning Outcomes

By the end of the course, the student must be able to:

- Model a quantum problem through numerical tools
- Identify suitable algorithms to solve or approximately solve a certain quantum problem
- Discuss the limitations of a given algorithm
- Carry out computer simulations of physical systems

Teaching methods

Ex cathedra with computational exercises

Expected student activities

Practical assignments will be given every week.

Solutions to the assignments will be handed out and the homework will not be graded.

It is strongly advised however to make the effort to do the homework weekly. The final computational exam will evaluate the understanding of the practical implementation aspects of the computational methods and will need students to apply techniques covered during the exercise sessions.

Assessment methods

The course is graded through a computational exam in the last week of the course (50% of the grade), as well as an oral exam (50% of the grade) during the regular exam session.

The oral exam will assess both the general theory as well as the understanding of the practical implementation of the algorithms.

Number of positions	

Summary

The two main topics covered by this course are classical molecular dynamics and the Monte Carlo method.

Content

The main focus of this course is the conceptual understanding of the potential and limitations of various simulation algorithms in the context of classical molecular dynamics and the Monte Carlo method. The Lennard-Jones liquid is extensively used for both methodologies as a case study for practical application. The codes for running the simulations are license-free and are provided. The emphasis of this course is on extracting physically relevant information from the simulations. Since the codes are provided, programming abilities may be helpful but do not correspond to the targets of this course. The main themes touched upon in the course are given below:

Ordinary differential equations: methods for numerical integration: multistep algorithms and implicit algorithms.

Classical molecular dynamics: Verlet algorithm, predictor-corrector algorithms, determination of macroscopic parameters, Nosé-Hoover thermostat, constraints, Ewald summations, application to Lennard-Jones liquids.

Random variables: definitions and properties, generators and distribution functions, central-limit theorem.

Random walks: binomial and Gaussian distributions, particle diffusion, Brownian motion.

Monte Carlo integration: direct sampling, importance sampling, Metropolis algorithm, errors in correlated sampling, Monte-Carlo simulations of Lennard-Jones liquids and of two-dimensional spin systems.

Learning Prerequisites**Recommended courses**

Statistical physics

Important concepts to start the course

Basic concepts from statistical physics

Learning Outcomes

By the end of the course, the student must be able to:

- Interpret experimental properties using computer simulations based on molecular dynamics and the Monte Carlo method
- Carry out computer simulations based on molecular dynamics and the Monte Carlo method

- Synthesize results in the form of a scientific report
- Choose an appropriate simulation method among those seen in the course
- Describe the simulation algorithms seen in the course
- Apply the methodologies seen in the course
- Explain the simulation algorithms seen in the course and associated issues.
- Assess / Evaluate errors associated with physical properties extracted from the simulations

Assessment methods

Report + oral exam = 1 grade

Electron microscopy: advanced methods

Alexander Duncan

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Materials Science and Engineering	MA2, MA4	Opt.
Minor in Imaging	E	Opt.
Physicien	MA2, MA4	Opt.

Language of teaching	English
Credits	4
Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

With this course, the student will learn about advanced methods in transmission electron microscopy, especially what is the electron optical setup involved in the acquisition, and how to interpret the data. After the course, students will be able to understand and assess TEM encountered in papers.

Content

1. Electron diffraction.
2. TEM imaging and diffraction contrast.
3. Phase contrast/high-resolution TEM.
4. Scanning TEM.
5. EDX, EEL-spectroscopy for analytical TEM.

Exercises and demonstrations concern these themes.

Learning Prerequisites**Required courses**

- Electron microscopy : introduction (*ideally*)
- Basic knowledge of solid state physics, crystallography, crystal defects

Learning Outcomes

By the end of the course, the student must be able to:

- Choose the appropriate TEM technique adapted to their problems
- Recognize the TEM techniques used in a publication
- Interpret TEM data (images, diffraction patterns, chemical analyses)
- Present the TEM results
- Expound on the electron-matter interactions leading to the data

Transversal skills

- Write a scientific or technical report.

Teaching methods

Eight weeks of the course are in a mainly "flipped" format, using MOOC-type online video lectures and quizzes. The remaining weeks use a conventional format. We alternate between the two formats over the semester.

During the "flipped" weeks, students will participate in interactive demonstrations at the microscopes, where they can see and practice the techniques discussed in the lectures. They will also have interactive Q&A sessions. Demos at the microscopes are also given during the "conventional" weeks, to illustrate various more advanced techniques like aberration-corrected imaging.

Expected student activities

Follow the online teaching material *before* attending the TEM session for the 8 weeks of flipped format.

Assessment methods

Project based evaluation with one individual report + oral evaluation during the exam period.

The written report has to be submitted by the second Sunday after the end of teaching. Each student will be individually interviewed based on this report and the full course content during the exam session.

The grade will be 50% written report 50% oral exam.

Summary

The course covers relevant experimental and theoretical concepts in nanoscale science, from fundamental aspects like quantum tunneling and quantum size effects, to hot topics like quantum transport and nanoscale magnetism.

Content

Review of electronic properties: from atoms to bulk
 Confinement of electronic states
 Imaging and manipulation at the atomic scale
 Making the nanostructures: top-down and bottom-up approaches
 Advances in field-effect transistors (FETs): solid state devices (SSD), 2D-FETs
 Quantum transport in 1D, and in 0D (single-electron FET)
 Magnetism at the nanoscale: magnetic data storage (HDD), introduction to spintronics

Learning Prerequisites**Recommended courses**

Solid state physics

Learning Outcomes

- Explain the differences between nanoscopic and macroscopic scale
- Analyze the results of a scientific experiment
- Design a scientific experiment

Transversal skills

- Summarize an article or a technical report.
- Access and evaluate appropriate sources of information.
- Use a work methodology appropriate to the task.

Exercises	2 weekly
Number of positions	

Summary

The goal of this course is to illustrate how modern principles of basic science approaches are integrated into the major biomedical imaging modalities of importance to biology and medicine, with an emphasis on those of interest to in vivo.

Content

1. Introduction to the course, importance and essential elements of bioimaging - lab visit of CIBM
2. Ultrasound imaging; ionizing radiation and its generation
3. X-ray imaging - when the photon bumps into living tissue, radioprotection primer
4. Computed tomography - From projection to image
5. Emission tomography - what are tracers and how to "trace" them in your body, x-ray detection, scintillation principle
6. Positron emission tomography (PET) - imaging anti-matter annihilation
7. Tracer kinetics - modeling of imaging data
8. Introduction to biological magnetic resonance (MR) - Boltzmann distribution, from spins to magnetization
9. Excitation of spins, Relaxation, the Basis of MR contrast (The Bloch Equations)
10. MR spectroscopy: In vivo Biochemistry, without chemistry ...
11. From Fourier to image: Principles of MR image formation, k-space - echo formation
12. Basic MRI contrast mechanisms, BOLD fMRI, contrast agents
13. Spin gymnastics: Imaging Einstein's random walk - fiber tracking. Overview of imaging modalities treated in this course

Keywords

Ultrasound
MRI
PET
SPECT
CT
Radioprotection

Learning Prerequisites**Recommended courses**

General Physics I-III

Important concepts to start the course

Fourier transformation

Learning Outcomes

By the end of the course, the student must be able to:

- Deduce which imaging technique is appropriate for a given situation.
- Describe their fundamental promises and limitations
- Differentiate the imaging modalities covered in the course.
- Deduce which imaging technique is appropriate for a given situation
- Describe their fundamental promises and limitations
- Differentiate the imaging modalities covered in the course

Transversal skills

- Assess one's own level of skill acquisition, and plan their on-going learning goals.
- Manage priorities.

Teaching methods

Ex cathedra with experimental demos

Expected student activities

strong participation in course and exercises

Assessment methods

a written exam

Supervision

Office hours	Yes
Assistants	Yes

Summary

This course presents modern aspects of theoretical condensed matter physics with interfaces to statistical physics, quantum information theory, quantum field theory and quantum simulation.

Content

- Quantum Phase Transitions
- Topological Order
- Entanglement in Quantum Many Body Systems
- Non-Equilibrium Dynamics
- Lattice gauge theories in Condensed Matter and Synthetic Quantum Many Body Systems

Learning Prerequisites**Recommended courses**

Solid State Physics III
Statistical physics III

Learning Outcomes

By the end of the course, the student must be able to:

- Theorize modern approaches to interacting quantum matter

Transversal skills

- Continue to work through difficulties or initial failure to find optimal solutions.
- Demonstrate a capacity for creativity.
- Access and evaluate appropriate sources of information.
- Summarize an article or a technical report.

Teaching methods

Ex cathedra and exercises supervised in classroom

Assessment methods

Oral Exam (100%)

PHYS-439

Introduction to astroparticle physics

Neronov Andrii, Perrina Chiara, Savchenko Volodymyr

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Physicien	MA2, MA4	Opt.

Language of teaching	English
Credits	4
Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

We provide a comprehensive overview of astroparticle physics, bridging the microworld of cosmic messengers with the large-scale structure and evolution of the Universe. We also explore the detection techniques and technologies that make this investigation possible.

Content

1. The observed universe: cosmological expansion, age of the universe, cosmic microwave background radiation.
2. Dark matter in the Universe. Rotation curves of the galaxies, experiments on detection of dark matter.
3. Astrophysical sources of high-energy gamma quanta and cosmic rays.
4. Pulsars and supernovae. Neutrinos from the supernova SN1987A.
5. High-energy particle acceleration near magnetized neutron stars.
6. Astrophysical black holes: stellar mass black holes and supermassive black holes in the nuclei of active galaxies.
7. High-energy particle acceleration and production of cosmic rays by the black holes.
8. Charged cosmic rays: energy flux and composition; origin, acceleration and propagation. Direct detection of cosmic rays: AMS, DAMPE and future experiments. Extensive air showers: composition, longitudinal and lateral profiles. The indirect detection of cosmic rays: the Pierre Auger Observatory.
9. Cosmic photons: production mechanisms and sources; the multiwavelength astronomy. Direct detection of cosmic gamma rays: the Fermi experiment. Indirect detection of cosmic gamma rays: imaging atmospheric Cherenkov telescopes and extensive air shower detectors. Current and future experiments
10. Astrophysical neutrinos: production mechanisms and candidate sources. The neutrino astronomy and the neutrino telescopes: KM3NeT and IceCube

Learning Prerequisites**Recommended courses**

Nuclear and particle physics I and II (PHYS-311, PHYS-312)

Learning Outcomes

By the end of the course, the student must be able to:

- Analyze the physical phenomena associated with cosmic rays
- Discuss the detection principles of astroparticle physics experiments
- Interpret the main results of selected experiments
- Assess / Evaluate the state of the art of astroparticle physics

Teaching methods

Ex cathedra and classroom exercises

Assessment methods

oral exam (100%)

PHYS-448

Introduction to particle accelerators

Pieloni Tatiana

Cursus	Sem.	Type
Ing.-phys	MA1, MA3	Opt.
Nuclear engineering	MA1	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	4
Session	Winter
Semester	Fall
Exam	Written
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

The course presents basic physics ideas underlying the workings of modern accelerators. We will examine key features and limitations of these machines as used in accelerator driven sciences like high energy physics, materials and life sciences.

Content

Overview, history and fundamentals
 Transverse particle dynamics (linear and nonlinear)
 Longitudinal particle dynamics
 Synchrotron radiation and related dynamics
 Linear and circular accelerators
 Acceleration and RF-technology
 Beam diagnostics
 Accelerator magnets
 Medical application of accelerators
 Future projects

Learning Outcomes

By the end of the course, the student must be able to:

- Design basic linear and non-linear charged particles optics
- Elaborate basic ideas of physics of accelerators
- Use a computer code for optics design
- Optimize accelerator design for a given application
- Estimate main beam parameters of a given accelerator

Transversal skills

- Communicate effectively with professionals from other disciplines.
- Use both general and domain specific IT resources and tools

Teaching methods

lecture based teaching using slides and blackboard,
 occasionally inquiry based learning,
 using Jupiter notebooks to simulate accelerator dynamics,

Application of knowledge through concrete exercises and provision of individual feedback in tutorials

Expected student activities

working on weekly problems, submitting the solutions and participation in the computer tutorials

Assessment methods

written exam

PHYS-473

MRI Practicals on CIBM preclinical imaging systems

Cudalbu Moldovan Cristina Ramona, Lanz Bernard, Lê Thanh Phong

Cursus	Sem.	Type
Biomedical technologies minor	H	Opt.
Ing.-phys	MA1, MA3	Opt.
Minor in Imaging	H	Opt.
Neuro-X	MA1, MA3	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	4
Withdrawal Session	Unauthorized Winter
Semester Exam	Fall During the semester
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Project	2 weekly
Number of positions	12
It is not allowed to withdraw from this subject after the registration deadline.	

Summary

The goal of this course is to teach students how to perform basic MRI and MRS experiments in-vivo and ex-vivo directly on preclinical horizontal ultra-high field MRI systems.

Content

Main topics addressed in the course:

1. Introduction to MRI: Nuclear spin and magnetic moment, nmr-active nuclei/isotopes, macroscopic magnetization, classical description of magnetic resonance, FID, spin echo, gradient echo signal acquisition.
2. Basic anatomical imaging and contrast: T1, T2 and T2* weighted images, impact of acquisition parameters on image contrast
3. Introduction to advanced MRI and contrast : fast MRI, 3D imaging, volumetry, diffusion MRI, *in vivo* vs *ex vivo* imaging, volume vs surface RF coils properties
4. Introduction to Magnetic Resonance Spectroscopy (MRS), data acquisition and processing using MRS4Brain toolbox : ¹H metabolites resonance patterns, chemical shift, J-coupling, shimming, MRS localization approaches, water signal suppression, outer volume signal suppression, metabolites quantification.
5. Introduction to Magnetic Resonance Spectroscopic Imaging (MRSI), reconstruction, data acquisition and processing using MRS4Brain toolbox : Basics of spectroscopic imaging, signal encoding for localization, 2D and 3D MRSI, FID vs echo-based MRSI
6. Basic artifacts in MRS and MRI and how to avoid them
7. Data processing: volumetry, DTI, metabolic imaging

Keywords

Magnetic Resonance Imaging (MRI), Magnetic Resonance Spectroscopy (MRS), Brain, ultra high magnetic field, metabolic imaging, brain metabolites, spin physics, processing/quantification,

Learning Prerequisites**Required courses**

General Physics
Electromagnetism
Basic signal processing

Important concepts: Fourier transformation

Recommended courses

Fundamentals of biomedical imaging - PHYS-438
Neural signals and signal processing - Fiche de cours - NX-421
Quantum physics
Signaux et systèmes

Important concepts to start the course

NMR, MRI basics

Learning Outcomes

By the end of the course, the student must be able to:

- Understand the physical principles of MRI and MRS during hands on exercises on MRI scanners
- Perform basic MRI and MRS experiments
- Establish MRI and MRS acquisition protocols and understand the impact of the acquisition parameters on image contrast or spectral pattern
- Analyze the results for the acquired data
- Explain the basics of organizing a successful MRS experiment, processing/quantification, image processing, using MRS4Brain toolbox
- Read, analyze and discuss representative scientific papers
- Discover the power of interdisciplinary interaction by working on questions and hands on exercises in groups

Transversal skills

- Use both general and domain specific IT resources and tools
- Communicate effectively with professionals from other disciplines.
- Write a literature review which assesses the state of the art.
- Write a scientific or technical report.

Teaching methods

In general the course will be organized as follows:

- 2h theoretical
- 2h practical at the scanner

Expected student activities

Active participation in the theoretical courses with questions
Discussions/questions during the live demos
Supervised experimental manipulation of the MRI scanner
Processing of the acquired data
Work in teams for a joint report/project

Assessment methods

Report/mini project

Supervision

Office hours	Yes
Assistants	Yes

PHYS-467

Machine learning for physicists

Zdeborová Lenka

Cursus	Sem.	Type
Chimiste	MA1, MA3	Opt.
Ing.-phys	MA1, MA3	Opt.
Physicien	MA1, MA3	Opt.
Quantum Science and Engineering	MA1, MA3	Opt.

Language of teaching	English
Credits	6
Session	Winter
Semester	Fall
Exam	Written
Workload	180h
Weeks	14
Hours	5 weekly
Courses	2 weekly
Exercises	2 weekly
Project	1 weekly
Number of positions	

Summary

Machine learning and data analysis are becoming increasingly central in sciences including physics. In this course, fundamental principles and methods of machine learning will be introduced and practised.

Content

- * Examples and types of problems that machine learning can solve.
- * Linear regression in matrix notation. The concept of prediction, estimation. Least squares method. High-dimensional underdetermined problems and the concept of regularization aka ridge regression. Polynomial regression. The concept of bias and variance trade-off and overfitting. Usage of train, validation and test sets.
- * Reminder of key concept from probability theory. Bayesian inference, maximum likelihood and maximum a posteriori estimation.
- * Least-squares as maximum likelihood of probabilistic model with additive Gaussian noise. Regularization as a prior. Relation with inverse problems in signal processing. Generalized linear model.
- * Robust regression, sparse regression, LASSO. Role of sparsity for variable selection. Compressed sensing.
- * Gradient descent and stochastic gradient descent.
- * Linear classification. Examples of classification losses. Logistic regression and its probabilistic interpretation. Multi-class classification, one-hot-encoding of classes, cross-entropy loss. Data that are not linearly separable. K-nearest neighbours. Curse of dimensionality.
- * Unsupervised learning, dimensionality reduction, low-rank approximation. Singular values decomposition (SVD) and principal component analysis (PCA).
Examples: Recommender systems, reconstruction of Europe geography from human genome, spin-glass card game aka planted spin glass model.
- * Analogy between learning/inference in high dimension and statistical mechanics. Maximum a posteriori estimation as search for the ground state.
Minimum mean squared error estimator. Bayesian inference as sampling from the Boltzmann measure.
- * Monte Carlo Markov Chains and their basic principles. Metropolis-Hastings update rule.
Gibbs sampling aka heat bath. Simulated annealing.
Bayesian learning of hyper-parameters, expectation maximization algorithm.
- * Clustering. The k-means algorithm. Gaussian mixture model.
- * Non-linear regression as linear regression in feature space. Representer theorem. Kernel methods as infinite-dimensional feature spaces. Kernel ridge regression. Examples of kernels and their feature spaces. Kernels as universal approximations. Classification with kernels, support vector machines.
- * Random feature regression as approximation of kernels. One hidden-layer neural networks as features learning machines. Neural networks as universal approximators. Worst case computational hardness of training. Multi-layer neural networks as learning features of features.
- * Deep learning for regression and classifications. Terminology of multi-layer feed-forward neural networks. Training with stochastic gradients descent aka the back-propagation algorithm. Discussion of hyper-parameters to be set when using neural networks. Historical notes and comments on performance of deep learning.
Importance of locality and translational symmetry. Convolutional neural networks for image classification. Design and terminology of convolutional and pooling layers.

Modus operandi of deep neural networks. Over-parametrization and lack of overfitting. Double descent behaviour replaced the bias-variance trade-off. Interpolation of the training set and its consequences for training, implicit regularization.

Concept of transfer learning, adversarial examples, data augmentation.

* Self-supervised learning. Data generative models. The principle of auto-encoder, its training and usage. Boltzmann machine. Maximum entropy principle. Training algorithm for the Boltzmann machine. Flow and diffusion-based generative models.

* Attention mechanism and attention layers. Basics of transformer architectures.

Learning Prerequisites

Important concepts to start the course

Basic notions in probability, analysis and basic familiarity with programming. Some notions of statistical physics will be used to support this lecture.

Learning Outcomes

By the end of the course, the student must be able to:

- Use basic tools for data analysis and for learning from data
- Explain basic principles of data analysis and learning from data
- List and explain machine learning tools suited for a given problem.

Teaching methods

2h of lecture + 2h of exercise (exercise mostly with a computer)

Assessment methods

Final written exam counting for 50% and several graded homeworks during the semester counting for the other 50%.

PHYS-491

Magnetism in materials

Zivkovic Ivica

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Physicien	MA2, MA4	Opt.

Language of teaching	English
Credits	4
Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

The lectures will provide an introduction to magnetism in materials, covering fundamentals of spin and orbital degrees of freedom, interactions between moments and some typical ordering patterns. Selected experimental techniques and their application in current research will be presented.

Content

1. Introduction (spin and orbital moments, Pauli matrices)
2. Isolated magnetic moments (diamagnetism, paramagnetism, Hund rules)
3. Crystal fields (ligand environment of magnetic ions, Jahn-Teller effect)
4. Interactions (dipole, direct exchange, super-exchange, anisotropic and asymmetric exchange)
5. Long-range magnetic order (ferromagnetism, Weiss model, critical behavior, excitations)
6. Long-range magnetic order (antiferromagnetism, incommensurate order, spin-glass)
7. Magnetism in metals (Pauli paramagnetism, Stoner mechanism, Landau levels)
8. Magnetism in metals (spin-density wave, RKKY, Kondo effect)
9. Measurement techniques 1 (magnetization, susceptibility)
10. Measurement techniques 2 (specific heat, ESR)
11. Measurement techniques 3 (NMR, μ SR)

Learning Prerequisites**Required courses**

Classical electrodynamics
Quantum Physics 1

Recommended courses

Quantum Physics 2
Solid State Physics 1
Solid State Physics 2

Learning Outcomes

By the end of the course, the student must be able to:

- Define fundamental sources of magnetism
- Explain the behavior of magnetic moments in magnetic fields
- Work out / Determine spin states from ligand environment
- Elaborate common magnetic interactions and their properties
- Contrast typical long-range ordered states in magnetism

- Discuss how magnetism arises in metals
- Demonstrate similarities and differences in low-dimensional magnetic systems
- Specify the role of a given experimental technique in investigation of magnetic materials

Transversal skills

- Demonstrate the capacity for critical thinking
- Summarize an article or a technical report.
- Make an oral presentation.

Teaching methods

Lectures with exercises.

Assessment methods

Oral exam.

Supervision

Office hours	Yes
Assistants	Yes
Others	Office hours: appointments can be arranged by email.

Summary

This lecture is a more advanced course in fonctionnel Analysis, presenting techniques with spécial interests for quantum Mechanics

Content

Nuclear spaces
 Schwartz Nuclear théorèm.
 Nuclear spectral théorèm.

Functionnal intégration
 Brownian motions
 Bochner-Minlos théorèm.

Keywords

distributions.
 family of semi-norms
 fonctionnal integration

Learning Prerequisites**Required courses**

Analysis 1 to 4
 Advanced linear algebra
 mathematical methods for physicists
 Quantum mechanic I and II

Important concepts to start the course

Basic topology
 Hilbert and Banach spaces
 Lebesgue integration

Learning Outcomes

By the end of the course, the student must be able to:

- Transcribe physics in math
- Develop

- Model

Transversal skills

- Continue to work through difficulties or initial failure to find optimal solutions.
- Demonstrate the capacity for critical thinking
- Demonstrate a capacity for creativity.
- Communicate effectively, being understood, including across different languages and cultures.

Teaching methods

Ex-cathedra

Expected student activities

The students are expected to participate actively in the lecture.

Assessment methods

The exam will be in oral form.

Summary

This course aims at teaching basic notions and tricks of microwave engineering to students with only an elementary knowledge of applied electromagnetism. Emphasis is made on topics that often arise in modern physics experiments, including quantum science and technology research.

Content

- Review of basic notions in electromagnetism
- Lumped element circuits, impedance, telegrapher's equation, impedance matching
- Transmission lines
- Introduction to network analysis
- Impedance transformers
- Resonators
- Power dividers and hybrid couplers
- Non-reciprocal devices
- Noise in linear and non-linear circuits
- Amplifiers
- Microwave systems and system noise temperature
- Radiometry

Keywords

Microwaves, low-noise measurements

Learning Prerequisites**Required courses**

Linear algebra, calculus, differential equations, electromagnetism

Important concepts to start the course

Working knowledge of complex numbers, calculus, and linear algebra; in-depth understanding of classical

Maxwell's equations.

Learning Outcomes

By the end of the course, the student must be able to:

- Construct elementary microwaves-based measurement setups for table-top physics experiments
- Apply basic notions of electromagnetism to analyse microwave measurement setups

Teaching methods

Lectures and demonstration, simulation projects, possibility of in-lab projects

Expected student activities

Attending lectures, seminars, independent study, individual project study

Assessment methods

Oral final exam (project presentation)

Supervision

Office hours	Yes
Assistants	Yes

Modeling and design of experiments

Fuerbringer Jean-Marie

Cursus	Sem.	Type
Ing.-phys	MA1, MA3	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	4
Session	Winter
Semester	Fall
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	1 weekly
Project	1 weekly
Number of positions	

Summary

In the academic or industrial world, to optimize a system, it is necessary to establish strategies for the experimental approach. The DOE allows you to choose the best set of measurement points to minimize the variance of the results. The concepts learned are applicable in all areas.

Content

- Fundamentals of DOE theory and data analysis
- Multilinear regression
- Greco-Latin squares
- Placket-Burman designs
- Factorial and fractional factorial designs
- Surface response designs
- Mixture designs

Keywords

Design of experiments, ANOVA, Least square fit, Statistics, Multilinear regression, variance minimization

Learning Prerequisites**Recommended courses**

Statistics, metrology

Important concepts to start the course

Basic statistical concepts such as average, variance, statistical distributions, Calculus, linear algebra matriciel, Matlab or Python fundamentals, coding fundamentals

Learning Outcomes

By the end of the course, the student must be able to:

- Propose an empirical model in function of the experimental objectives
- Analyze an experimental situation and identify the critical elements from a statistical point of view

- Establish a design of experiments in relation with the candidate models and the experimental constraints

Transversal skills

- Plan and carry out activities in a way which makes optimal use of available time and other resources.
- Use a work methodology appropriate to the task.
- Demonstrate the capacity for critical thinking
- Use both general and domain specific IT resources and tools

Teaching methods

This course combines theoretical instruction with practical exercises and a hands-on application project:

- **Theoretical Presentation:** Core concepts and principles are introduced through lectures and discussions.
- **Case Calculations and Analysis:** Students apply theoretical knowledge to solve exercises, reinforcing learning through calculation and critical analysis.
- **Application Project:** Each year, a unique project is assigned to the entire class. Students work in groups to complete the project collaboratively. Project sessions are scheduled as two-hour blocks every two weeks (effectively one hour per week, but condensed for deeper engagement).

This structure encourages active learning, teamwork, and the practical application of course concepts.

Expected student activities

- Synthesized the theoretical presentation in personal summary with concept maps
- Solve exercise problems

Assessment methods

1/3 Imposed project prepared and reported in group of 3 students

2/3 Oral exam consisting in presenting individually the project (1/3) and answering theoretical question (1/3)

Summary

This course is an introduction to holography, the modern approach to quantum gravity.

Content

1. Motivation from black hole thermodynamics
2. The very basics of string theory
3. Statement of the correspondence (discussion of the decoupling limit)
4. A basic introduction to CFT and to the geometry of AdS
5. Computing correlation functions (time permitting: holographic renormalization, real time, finite temperature)
6. Entanglement and the emergence of gravity (time permitting)
7. Beyond AdS/CFT: non-conformal and other backgrounds (time permitting)

Keywords

AdS/CFT, holography

Learning Prerequisites**Required courses**

General Relativity, QFT

Remark

Next time: Fall

Summary

Neutron and X-ray scattering are some of the most powerful and versatile experimental methods to study the structure and dynamics of materials on the atomic scale. This course covers basic theory, instrumentation and scientific applications of these experimental methods.

Content

The application of neutron and X-ray scattering spans from crystalline matter to bio-materials and engineering, including fields like magnetism and superconductivity. Similar to the vast possibilities with X-rays at synchrotron facilities like the Swiss Light Source at the Paul Scherrer Institute (PSI) in Switzerland, the European Synchrotron Radiation Facility in Grenoble, neutron scattering is a large-scale-facility technique with neutron sources among others at PSI in Switzerland, the Institute Laue-Langevin in Grenoble and a new joint European Spallation Source under construction in Sweden. The course provides an introduction to the dynamic experimental techniques of neutron and X-ray scattering and covers the following aspects:

- 1) Theory of the neutron scattering cross section
- 2) Neutron sources and neutron instrumentation
- 3) Neutron imaging, neutron reflectivity and neutron small angle scattering
- 4) Neutron diffraction, crystal structures
- 5) Inelastic neutron scattering, phonons
- 6) Magnetic neutron scattering, magnetic structures
- 7) Inelastic magnetic neutron scattering, magnetic dynamics
- 8) Theory of the interaction between X-rays and matter
- 9) X-ray sources and X-ray instrumentation
- 10) X-ray absorption spectroscopy
- 11) X-ray emission spectroscopy and Resonant Inelastic X-ray Scattering (RIXS)
- 12) Resonant Elastic X-ray Scattering (REXS)
- 13) Inelastic X-ray Scattering
- 14) Time resolved pump-probe X-ray spectroscopy

The course contains lectures and exercise sessions. Exercise sessions will contain derivation of relevant formulas, Monte-Carlo simulation of neutron scattering experiments, and discussions of representative scientific articles using X-ray and neutron scattering techniques.

The course includes performing a real neutron or X-ray experiment and a tour of the large-scale experimental research facilities at the PSI.

Keywords

Neutron Scattering, X-ray scattering, X-ray spectroscopy, diffraction, crystal structures, lattice vibrations, phonons, magnetism, spin waves, magnons, neutron imaging

Learning Prerequisites**Required courses**

Solid State Physics 1 and 2, basic quantum mechanics and basic atomic physics

Recommended courses

Magnetism in Materials

Learning Outcomes

By the end of the course, the student must be able to:

- Plan, predict and interpret neutron and X-ray scattering experiments.
- Read and evaluate articles containing neutron and X-ray scattering results.

Assessment methods

Oral

Nonlinear dynamics, chaos and complex systems

Février Olivier

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Physicien	MA2, MA4	Opt.

Language of teaching	English
Credits	6
Session	Summer
Semester	Spring
Exam	Oral
Workload	180h
Weeks	14
Hours	5 weekly
Courses	3 weekly
Exercises	2 weekly
Number of positions	

Summary

The course provides students with the tools to approach the study of nonlinear systems and chaotic dynamics. Emphasis is given to concrete examples and numerical applications are carried out during the exercise sessions.

Content

The course consists of three parts.

Part 1: Nonlinear dynamics

- One-dimensional and two-dimensional systems, phase-plane analysis, elementary bifurcations, limit cycles, and Hopf bifurcations

Part 2: Chaos

- Lorenz system and chaotic dynamics
 - Iterated maps, period-doubling, chaos, universality
 - Fractals
 - Strange attractors

Part 3: Introduction to complex systems

- The science of complexity
 - Examples of complex systems, networks, etc.

Keywords

Chaos, Nonlinear systems, Complex system, Fractals, Differential equations, Bifurcations.

Learning Prerequisites**Required courses**

Introductory Physics and Math courses.

Learning Outcomes

By the end of the course, the student must be able to:

- Manipulate the fundamental elements of nonlinear systems and chaotic dynamics

Teaching methods

Ex cathedra and exercises in class.

Assessment methods

Oral Exam

Session	Summer
Semester	Spring
Exam	Written
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course provides the fundamental knowledge and theoretical tools needed to deal with nonlinear optical interactions, covering both classical and quantum theory of nonlinear optics.

Content

Nonlinear optics is used for the generation and conversion of quantum states of light, with numerous applications in quantum technologies. In parallel, the development of photonic integrated circuits and micro/nano-cavities offers new opportunities to boost and tailor nonlinear effects. Finally, nonlinear spectroscopy on molecules and nanomaterials is a powerful tool to probe their electronic and vibrational properties. This course covers the fundamental knowledge needed to understand these contemporary developments.

Fundamentals of nonlinear optics

- Reminders: wave propagation in a linear medium with dispersion
- Wave propagation in a nonlinear medium and phase matching conditions
- The nonlinear susceptibility tensor and crystal symmetries
- Generation of coherent states at new frequencies (second harmonic, sum- and difference frequency, etc.)

Quantum theory of nonlinear optics and its applications

- Quantum theory of the nonlinear susceptibility (first quantisation, semi-classical treatment). Particular case of the two-level system.
- Quantization of the electromagnetic field
- Effective Hamiltonian of nonlinear interactions
- Generation of nonclassical states of light: the case of parametric down conversion
- The joint spectral amplitude and the two-mode squeezed state
- Integrated nonlinear optics in waveguides and cavities
- Application to quantum frequency conversion, quantum networks, etc.

Invited seminars and tutorials from researchers active in some of these fields (quantum frequency conversion, integrated quantum optics, etc.) will enrich the course with practical examples from contemporary research.

Keywords

Nonlinear optics, quantum optics, photonics, quantum technologies, integrated optics, optical spectroscopy

Learning Prerequisites

Required courses

Classical electrodynamics (or any equivalent introduction to optical waves in a medium)
Quantum mechanics (perturbation theory and the harmonic oscillator)

Learning Outcomes

By the end of the course, the student must be able to:

- Formulate quantum models of nonlinear optical interactions
- Compute wave propagation in linear and nonlinear media, in waveguides and low-dimensional geometries
- Describe applications of nonlinear optics in classical and quantum technologies
- Predict the quantum state of light generated by a specific nonlinear process

Assessment methods

Final written exam.

Supervision

Office hours	Yes
Assistants	Yes

Nuclear fusion and plasma physics

Fasoli Ambrogio

Cursus	Sem.	Type
Auditeurs en ligne	H	Opt.
Energy Science and Technology	MA1, MA3	Opt.
Ing.-phys	MA1, MA3	Opt.
Nuclear engineering	MA1	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	4
Session	Winter
Semester	Fall
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

The goal of the course is to provide the physics and technology basis for controlled fusion research, from the main elements of plasma physics to the reactor concepts.

Content

- 1) Basics of thermonuclear fusion
- 2) The plasma state and its collective effects
- 3) Charged particle motion and collisional effects
- 4) Fluid description of a plasma
- 5) Plasma equilibrium and stability
- 6) Magnetic confinement: Tokamak and Stellarator
- 7) Waves in plasma
- 8) Wave-particle interactions
- 9) Heating and non inductive current drive by radio frequency waves
- 10) Heating and non inductive current drive by neutral particle beams
- 11) Material science and technology: Low and high Temperature superconductor - Properties of material under irradiation
- 12) Some nuclear aspects of a fusion reactor: Tritium production
- 13) Licensing a fusion reactor: safety, nuclear waste
- 14) Inertial confinement

Learning Prerequisites**Recommended courses**

Basicknowledge of electricity and magnetism, and of simple concepts of fluids

Learning Outcomes

By the end of the course, the student must be able to:

- Identify the main physics challenges on the way to fusion
- Design the main elements of a fusion reactor
- Identify the main technological challenges of fusion

Teaching methods

Ex cathedra and in-class exercises

Assessment methods

oral examen (100%)

Remark

Pas donné en 2025-26

Summary

This course will present an overview of the nuclear interactions for neutrons on nuclei below a few hundreds of MeV. The aspect of so-called "nuclear data" will be presented from the perspective of experiments, compilation, calculation, evaluation, processing and applications.

Content

The following subjects will be presented:

- Nuclear data needs: It is important to understand if, and where, nuclear data are needed, why, which accuracy is required from the applications or industries. Such needs concerns a large range of applications: energy, medical, waste and astrophysics. Each of these fields requires different knowledge on nuclear interactions with, either with neutrons, or protons, or both.
- Theoretical background: Many of the needs are covered by experimental knowledge, but not all. Some reactions cannot be easily measured, or are simply out of range with current technologies (for instance for with short-lived isotopes). What can we do in this case ? Part of the answer relies on theoretical understanding and the prediction power of current models (with their shortcoming). We will then explore (not in details) some of the important models, their range of applications, and what to do when nothing is known.
- Measurement facilities: The current knowledge of nuclear interactions, cross sections and uncertainties is based on measurements. In many instances, measurements are necessary due to the lack of prediction power for models. We will see the existing facilities, their advantages and drawback. We will also visit the installation worldwide, with a view on the future needs.
- Evaluation: Once quantities have been measured or calculated, they need to be presented to potential users. This step is called "evaluation". The outcome of the process is "what the users will see". It covers compiling measurements, combining them with theoretical predictions, formatting, and processing in forms that users need. We will go through these steps, and you will globally understand the importance of these steps.
- Applications: finally, we will see how these nuclear data are used. What are the applications, what are the needs, and how users can propose feedback to influence new measurements, or new calculations.

Keywords

Nuclear data, interaction, reaction, uncertainty, spent nuclear fuel

Learning Outcomes

By the end of the course, the student must be able to:

- Use applications codes

Assessment methods

written exam

Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

The course will cover the physics of particle detectors. It will introduce the experimental techniques used in nuclear and particle physics. The lecture includes the interaction of particles with matter, scintillators, gas detectors, silicon detectors, detectors for particle ID and photo-detectors.

Content

Interaction of particles in matter: ionization (Bethe-Bloch formula), interaction of electrons and photons (electromagnetic showers, radiation length and critical energy).

General characteristics of detectors: linearity, efficiency, resolution and Fano factor.

Gas detectors: ionization, proportional and Geiger-Muller counters, multiwire proportional, drift and time-projection chambers, micro-pattern gas detectors.

Semiconductor detectors: pn junction, silicon and germanium diode detectors, silicon microstrip and pixel detectors.

Scintillators: organic and inorganic scintillators, wavelength shifters and light guides.

Photodetectors: photomultipliers, photodiodes and other alternatives.

Applications: momentum measurement in magnetic fields, calorimetry, particle identification.

Learning Prerequisites**Recommended courses**

Elementary particle I, knowledge in nuclear and particle physics

Learning Outcomes

By the end of the course, the student must be able to:

- Categorize processes
- Describe energy deposit processes
- Quantify available signal

Transversal skills

- Communicate effectively with professionals from other disciplines.

Teaching methods

Slides, blackboard and exercises in class

Assessment methods

Semester work report evaluation 2/3 and presentation 1/3

Supervision

Office hours	No

Summary

Presentation of particle properties, their symmetries and interactions. Introduction to quantum electrodynamics and to the Feynman rules.

Content**Introduction:**

The Standard Model, a step toward Grand Unification.
Particle detection, accelerators.
Relativity, Klein-Gordon and Dirac equations.

Properties of particles:

Mass, charge, lifetime, spin, magnetic moment,...

Symmetries, conservation laws, and the quark model:

Invariance under space translation and rotation, parity, time reversal and charge conjugation. Violation of parity and CP, CPT theorem. Isospin.

QED:

Introduction to QED. Feynman rules. The form factors.

Tests of QED:

Electron-positron annihilation. Electron-proton scattering. Deep inelastic scattering and proton substructure. Electron and muon magnetic moments.

Learning Prerequisites**Recommended courses**

Nuclear and Particle Physics I and II, Quantum mechanics I and II

Learning Outcomes

By the end of the course, the student must be able to:

- Analyze sub-microscopical phenomena

Teaching methods

Ex cathedra and exercises in class

Assessment methods

written exam at the end of the semester (50%) + oral exam during exam session (50%)

Supervision

Assistants Yes

Summary

This course aims to make students familiar and comfortable with the main concepts of particle physics, providing a clear connection between the theory and relevant experimental results, including the most recent ones from modern particle physics experiments.

Content

- Quantum chromodynamics (QCD)
- Weak interaction
- Neutrinos and neutrino oscillations
- CP violation and weak interaction of hadrons
- Electroweak unification
- Precision tests of standard model
- Higgs boson: theory and discovery
- Dark matter and BSM theories

Learning Prerequisites**Recommended courses**

Nuclear and Particle Physics I and II, Quantum mechanics I and II, Particle Physics I

Learning Outcomes

By the end of the course, the student must be able to:

- Operate with the main concepts
- Describe processes in particle physics with the help of Feynman diagrams
- Solve related exercises

Teaching methods

Ex cathedra and exercises in class

PHYS-471

Particle physics: the flavour frontiers

Marchevski Radoslav

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Physicien	MA2, MA4	Opt.

Language of teaching	English
Credits	4
Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course will present experimental aspects of flavour physics primarily in the quark sector but also in the lepton sector and their role in the development of the Standard Model of particle physics.

Content

Important historical developments will be discussed, including key flavour physics observables and past experiment built to measure them. The course will delve into present state-of-the-art research and its unresolved problems and will discuss possible ways to address them at present and future flavour physics experiments.

Introduction

key theoretical concepts: the Standard Model, weak interactions, the Yukawa sector, quark-mixing matrix, Unitarity triangles, CP violation

Experimental aspects of flavour physics

past and present flavour-physics facilities and experiments, particle production at accelerators, main experimental principles

Flavour physics in the quark sector

meson decays, neutral meson oscillations, measurements of the angles of the Unitarity triangle, CP violation in meson decays, rare decays of K, B, and D mesons,

Test of the standard model and beyond

CKM fits, New physics flavour puzzle, Lepton Flavour Universality tests, charged lepton flavour violation

Keywords

flavour physics, particle physics, quark mixing, CP violation, meson decays

Learning Prerequisites**Recommended courses**

Nuclear and Particle Physics I and II, Quantum mechanics I and II, Particle Physics I. Quantum Field Theory I is also recommended.

Learning Outcomes

By the end of the course, the student must be able to:

- Analyze the sub-atomic physical phenomena
- Elaborate on modern experimental methods in flavour physics

Teaching methods

Ex cathedra and exercises in class

Assessment methods

written exam at the end of the semester (50%) + oral exam during exam session (50%)

Supervision

Assistants Yes

Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

Life has emerged on our planet from physical principles such as molecular self-organization, thermodynamics, stochastics and iterative refinement. This course will introduce the physical methods to study life and will discuss the quantitative and physical concepts that make life possible.

Content

- The structural organization of life
- Digitalization, Fourier transforms, error propagation, measurement methods
- Energy forms in life: Membrane potential, ATP, concentration gradients, protein folding
- Protein purification: Chromatography, Electrophoresis, Lab Overview
- Hydrodynamic methods, viscosity, cell sorting
- Surface effects, Osmosis, Calorimetry, ITC
- Spectroscopy with light
- Radiation Biophysics, Spectroscopy with NMR and SPR
- Mass Spectrometry
- Electron Microscopy in life sciences
- AFM
- Interactions between particle beams and living matter (Light, X-rays, OCT), Free Electron Laser

Learning Outcomes

By the end of the course, the student must be able to:

- Describe the molecules and structural arrangement of modern biological cells.
- Describe and quantitatively understand the physical mechanisms that drive living organisms.
- Explain the biophysical tools used to study the molecules of life and interpret their data.

Teaching methods

- 2 hours of class + 2 hour of exercises
- Students are invited to give one 10-min presentation on one of several possible topics during the semester.

Expected student activities

Homework will be given every week. Solutions will be handed out. Homework will not be graded. It is strongly advised to make the effort to do the homework weekly.

Assessment methods

- The course grading is composed of a final written exam
- Students should give a 10-min presentation on one of a given list of topics. Failure to give the presentation will lower the final grade by 0.5.

Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course covers the concepts and physics of matter at reduced dimensions. The fabrication and characterization of low-dimensional materials as well as their potential application is discussed. The critical review and presentation of scientific publications is trained.

Content

- Low-dimensional properties in 3D materials: Bulk materials that can be thought of as effectively 2D or 1D
- Artificial low-D materials in solid state: heterostructures, 2D electron gasses, superlattices
- Single-layer low-D materials: overview and fabrication (top-down, bottom-up)
- Analysis and characterization by scanning probe microscopy, photoemission and other surface analytical methods
- Quantum transport
- Polyacetylene - a prototypical 1D material
- Electronic transport/band structure at reduced dimension
- Surface states, topological effects
- Magnetism at reduced dimensions: Magnetic ordering, single molecule magnetism
- Physics of 2D and 1D carbon allotropes: graphene and graphene nanoribbons

Learning Prerequisites**Recommended courses**

Basic knowledge in solid state physics

Learning Outcomes

- Explain the differences of solid state at reduced dimensions with respect to bulk matter
- Critique a scientific publication/result
- Interpret knowledge of several specific experimental methods

Transversal skills

- Demonstrate the capacity for critical thinking
- Summarize an article or a technical report.

- Make an oral presentation.
- Use a work methodology appropriate to the task.
- Access and evaluate appropriate sources of information.

Teaching methods

- Ex cathedra with exercises in class
- Students' presentations of scientific articles

Assessment methods

50% oral exam, 25% exercises, 25% student presentation

Student presentation: each student reviews and presents a paper that is critically discussed in class.

Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course discusses materials physics associated with the mechanical and structural properties of solids, primarily focusing on the physics of dislocation defect dynamics and linking diffusion kinetics to the fundamental physics of phase transformations.

Content**1. Materials, definitions, structure**

Binding energy in metals, ceramics and polymers. Crystal structure and amorphous materials. Theory of elasticity: stress and strain fields.

2. Diffusion

Diffusion in alloys. Physical and chemical diffusion.

3. Plastic deformation and dislocations

Phenomenology. Deformation of single crystals. Burgers' vector. Elasticity theory: interactions among dislocations. Creation and annihilation of dislocations.

4. Dislocation dynamics

Friction forces due to the lattice, to point defects and to dislocations. Movement equations. Partial dislocations and stacking faults. Dissociation mechanisms: dislocations in face centred cubic metals.

5. Dislocation kinetics

Thermal activation of plastic deformation. Dislocation climb. Deformation tests. High resolution Electron microscopy of dislocation structures.

6. Thermodynamics of phase transformations

Thermodynamical principles of phase transformations. Phase diagrams. Alloy solidification. Solid-solid phase transformations.

Keywords

dislocations, deformation, diffusion, elasticity, phase transformations, melting, precipitation crystallography

Learning Prerequisites**Recommended courses**

linear algebra I,II
analysis III, IV
physics I,II

Learning Outcomes

By the end of the course, the student must be able to:

- Develop the formalism of dislocation theory
- Model the plastic deformation of materials
- Sketch a phase diagram and its thermodynamic basis
- Expound theories and ideas in published journal articles referencing dislocation and phase transformation theories

Transversal skills

- Use a work methodology appropriate to the task.
- Assess one's own level of skill acquisition, and plan their on-going learning goals.
- Make an oral presentation.

Teaching methods

Oral Lectures and exercises in the classroom. Lecture, exercise and reference materials will be made available on a Moodle. A questions and answer forum is also available on the moodle. Additionally, zoom meeting or in-classroom session will be arranged for exam preparation

Assessment methods

Oral exam in English

Supervision

Summary

Series of lectures covering the physics of quantum heterostructures, dielectric microcavities and photonic crystal cavities as well as the properties of the main light emitting devices that are light-emitting diodes (LEDs) and laser diodes (LDs).

Content**1. Semiconductor materials for optoelectronics****2. Semiconducting nanostructures**

- Growth techniques
- Quantum wells, superlattices, quantum dots and single photon emitters

3. Dielectric microcavities and photonic crystals

- Basic features of microcavities and photonic crystals, Purcell effect

4. Electroluminescence

- Light-emitting diodes, quasi-Fermi levels, emission spectra, efficiency, radiative and nonradiative lifetimes
- Applications: displays and solid-state lighting

5. Laser diodes

- Stimulated emission, material and modal gain, transparency and threshold currents, spectral characteristics, far-field and near-field emission patterns, efficiency, waveguides
- Fabry-Perot laser diodes, distributed feedback and vertical cavity surface emitting laser structures
- Bandgap engineering, quantum well laser diodes, separate confinement heterostructures
- Relaxation oscillation frequency
- Beyond conventional laser diodes: physics of high-beta# nanolasers
- Quantum cascade lasers

Learning Prerequisites

Required courses

Semiconductor physics and light-matter interaction (PHYS-433)

Quantum physics I and II (Bachelor)

Solid State Physics I and II (Bachelor), Quantum Electrodynamics and Quantum Optics (Master)

Recommended courses

Semiconductor physics and light-matter interaction (Master)

Quantum physics I and II (Bachelor)

Solid State Physics I and II (Bachelor), Quantum Electrodynamics and Quantum Optics (Master)

Learning Outcomes

- Sketch - and explain the band diagram of quantum engineered heterostructures (quantum wells, superlattices, quantum dots) subjected or not to an electric field
- Explain - the impact of the dimensionality of a semiconductor on excitonic properties
- Assess / Evaluate - the properties of single photon emitters and entangled photon sources made from semiconductor quantum dots
- Use - basic notions of quantum optics to classify light emitters: assessment of the coherence of a light-source via photon statistics (2nd-order correlation measurements)
- Explain - the origin of the enhancement of the spontaneous emission rate via the Purcell effect
- Assess / Evaluate - the performance of cavities (microcavities and photonic crystal slabs) in terms of quality factor and photon lifetime, Lambertian vs non-Lambertian light emission spectra
- Assess / Evaluate - the performance of LEDs: internal quantum efficiency, extraction efficiency, wall-plug efficiency, luminous efficiency, color rendering index of white light sources
- Link - the radiative and nonradiative carrier lifetimes to microscopic recombination paths in the framework of the ABC model (Shockley-Read-Hall, bimolecular recombination coefficient and Auger term)
- Explain - the operating behavior of light-emitting diodes and laser diodes by relying on rate equations
- Compute - the material gain of bulk semiconductors and quantum wells (notions of transparency and threshold currents, modal gain)
- Assess / Evaluate - the performance of laser diodes: output power, internal quantum efficiency, wall-plug efficiency
- Explain - the origin of the temporal coherence of laser diodes (narrow linewidth) and their modulation frequency (several Gbit/s for telecom applications)
- Distinguish - the main features of edge-emitting laser diodes and vertical cavity surface emitting lasers
- Sketch and explain the band diagram of quantum engineered heterostructures (quantum wells, superlattices, quantum dots) subjected or not to an electric field
- Explain the impact of the dimensionality of a semiconductor on excitonic properties
- Assess / Evaluate - the properties of single photon emitters and entangled photon sources made from semiconductor quantum dots
- Use basic notions of quantum optics to classify light emitters: assessment of the coherence of a light-source via photon statistics (2nd-order correlation measurements)
- Explain the origin of the enhancement of the spontaneous emission rate via the Purcell effect
- Assess / Evaluate the performance of dielectric cavities (microcavities and photonic crystal slabs) in terms of quality factor and photon lifetime, Lambertian vs non-Lambertian light emission spectra
- Assess / Evaluate the performance of LEDs: internal quantum efficiency, extraction efficiency, wall-plug efficiency, luminous efficiency, color rendering index of white light sources
- Link the radiative and nonradiative carrier lifetimes to microscopic recombination paths in the framework of the ABC model (Shockley-Read-Hall, bimolecular recombination coefficient and Auger term)

- Explain the operating behavior of light-emitting diodes and laser diodes by relying on rate equations
- Compute the material gain of bulk semiconductors and quantum wells (notions of transparency and threshold currents, modal gain)
- Assess / Evaluate the performance of laser diodes: output power, internal quantum efficiency, wall-plug efficiency
- Explain the origin of the temporal coherence of laser diodes (narrow linewidth) and their modulation frequency (several Gbit/s for telecom applications)
- Distinguish the main features of edge-emitting laser diodes and vertical cavity surface emitting lasers

Transversal skills

- Use a work methodology appropriate to the task.
- Plan and carry out activities in a way which makes optimal use of available time and other resources.
- Communicate effectively with professionals from other disciplines.
- Take feedback (critique) and respond in an appropriate manner.
- Summarize an article or a technical report.
- Access and evaluate appropriate sources of information.
- Demonstrate a capacity for creativity.
- Demonstrate the capacity for critical thinking

Teaching methods

Ex cathedra with exercises

Expected student activities

Weekly graded homeworks to secure 1 point out of 6 (16.6% of the final grade)

Read the bibliographical resources in order to fully integrate and properly use the physical concepts seen in the lectures and the exercises

Assessment methods

Written exam (with 1 point out of 6 earned via compulsory weekly homeworks (16.6%))

Supervision

PHYS-423

Plasma I

Theiler Christian Gabriel

Cursus	Sem.	Type
Energy minor	H	Opt.
Ing.-phys	MA1, MA3	Opt.
Nuclear engineering	MA1	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	6
Session	Winter
Semester	Fall
Exam	Oral
Workload	180h
Weeks	14
Hours	5 weekly
Courses	2 weekly
Exercises	3 weekly
Number of positions	

Summary

Following an introduction of the main plasma properties, the fundamental concepts of the fluid and kinetic theory of plasmas are introduced. Applications concerning laboratory, space, and astrophysical plasmas are discussed throughout the course.

Content**I Collisional and relaxation phenomena**

- Inelastic collisions: ionization and recombination, degree of ionization
- Elastic collisions: Coulomb collisions
- Isotropisation and thermalisation
- Plasma resistivity and the runaway regime

II Transport in plasmas

- Random walk and diffusion
- Ambipolar and cross-field diffusion
- Energy and particle confinement

III Waves in cold magnetized plasma

- Dielectric tensor
- Resonances and cut-offs
- Parallel and perpendicular propagation

IV Wave-particle interaction and kinetic description of waves in hot un-magnetized plasmas

- The Vlasov-Maxwell model
- Resonant wave-particle interaction and Landau damping
- Stability criteria and streaming instabilities
- Langmuir and ion-acoustic waves and instabilities

V Waves in hot magnetized plasmas**VI Examples of nonlinear effects****Learning Prerequisites****Recommended courses**

PHYS-324: Classical Electrodynamics, PHYS-325: Introduction to Plasma Physics

Learning Outcomes

By the end of the course, the student must be able to:

- Manipulate the fundamental elements of the plasma fluid and kinetic theory

Teaching methods

Ex cathedra and exercises in class

Assessment methods

oral exam

Resources

Physicien	MA2, MA4	Opt.

Language of teaching	English
Credits	6
Session	Summer
Semester	Spring
Exam	Oral
Workload	180h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course completes the knowledge in plasma physics that students have acquired in the previous two courses, with a discussion of different applications, in the fields of magnetic confinement and controlled fusion, astrophysical and space plasmas, and societal and industrial applications.

Content**A. Fusion energy**

- Basics (nuclear reactions, the Lawson criterion)
- Magnetic Confinement: MHD model
- Magnetic Confinement: Tokamak equilibrium, instabilities and operational limits
- Magnetic Confinement: Transport - theoretical basis and phenomenology
- Magnetic Confinement: Heating, burning plasmas, ITER and route to a power plant

B. Industrial applications

- The basics of plasma discharges for industrial applications
- Examples of plasma applications in industry and medicine

C. Plasmas in nature

- Astrophysics and space plasmas
- Solar physics - radiation transport and dynamo
- Magnetic reconnection and particle acceleration

D. Plasma diagnostics

- Categories of plasma diagnostics
- Measurements of plasma properties, magnetic properties and processes at the plasma-material interface

Learning Prerequisites**Recommended courses**

PHYS-324 Classical electrodynamics, PHYS-325 Introduction to plasma physics and PHYS-423 Plasma I.

Learning Outcomes

By the end of the course, the student must be able to:

- Describe various applications of plasma physics
- Identify the main components and physics issues of magnetic and inertial confinement fusion
- Describe the main scientific issues in astrophysical plasmas
- Describe the main advantages of plasmas in industrial applications
- Describe the physics basis of key plasma diagnostics
- Work out / Determine when plasma effects are important
- Identify the main components and physics issues of magnetic confinement fusion

Teaching methods

Cursus	Sem.	Type
Ing.-phys	MA1, MA3	Obl.
Physicien	MA1, MA3	Obl.

Langue d'enseignement	français / anglais
Crédits	8
Retrait	Non autorisé
Session	Hiver
Semestre	Automne
Examen	Pendant le semestre
Charge	240h
Semaines	14
Heures	8 hebdo
Projet	8 hebdo

Nombre de places

Il n'est pas autorisé de se retirer de cette matière après le délai d'inscription.

Résumé

L'étudiant-e applique les compétences acquises au cours de ses études dans une recherche effectuée dans l'un des laboratoires de la section de physique sous l'encadrement d'un-e enseignant-e de la section. Elle/il est présent dans le laboratoire un jour par semaine.

Contenu

Objectifs d'apprentissage: Pour les Projets de Physique (TP IV) effectués à la Section de Physique les sujets traités peuvent être de la physique théorique, expérimentale ou appliquée.

Pour les Projets de Physique (TP IV) effectués dans une autre section de l'EPFL, un descriptif doit être fourni à l'adjoint du directeur de la Section pour lui permettre de prendre une décision quant à l'adéquation du sujet avec la formation de physicien-ne.

Mots-clés

physique appliquée, expérimentation, recherche

Acquis de formation

A la fin de ce cours l'étudiant doit être capable de:

- Choisir ou sélectionner une méthode d'investigation
- Elaborer un projet de recherche
- Formuler une hypothèse
- Analyser des résultats expérimentaux
- Modéliser un système physique
- Exploiter des données
- Identifier les paramètres significatifs
- Représenter un modèle, un résultat expérimental
- Critiquer des hypothèses ou des résultats

Compétences transversales

- Utiliser une méthodologie de travail appropriée, organiser un/son travail.

- Communiquer efficacement et être compris y compris par des personnes de langues et cultures différentes.
- Être responsable de sa propre santé et sécurité au travail ainsi que de celles des autres.
- Gérer ses priorités.
- Persévérer dans la difficulté ou après un échec initial pour trouver une meilleure solution.
- Accéder aux sources d'informations appropriées et les évaluer.
- Écrire un rapport scientifique ou technique.
- Écrire une revue de la littérature qui établit l'état de l'art.

Méthode d'enseignement

Travail en laboratoire

Méthode d'évaluation

Un rapport écrit doit être fourni à la fin du travail

A written report must be provided at the end of the lab work

Summary

This course introduces quantum computing, starting with quantum mechanics and information theory. It covers the quantum circuit model, universal gates, foundational quantum algorithms, noise, quantum error correction, NISQ quantum algorithms, and an overview of recent progress.

Content**Introduction**

- Crash course on quantum mechanics
- Quantum measurement and interaction with the environment
- Foundations of classical and quantum information theory

Quantum computing

- The quantum circuit model
- Universal quantum gates
- Quantum advantage and the Deutsch-Jozsa algorithm

Overview of quantum algorithms

- The quantum Fourier transform and Shor's factoring algorithm
- The quantum state amplification and Grover's database search algorithm
- The quantum phase estimation and linear system solving
- Digital quantum simulation and unitary time evolution

Noise in quantum hardware and the digital noise model**Quantum error correction**

- The Shor quantum error correction code
- Stabilizer codes
- Fault-tolerant quantum computing and the threshold theorems

Hybrid quantum-classical algorithms for NISQ hardware

- The variational quantum eigensolver
- The quantum approximate optimization algorithm
- The variational quantum dynamics algorithms

Overview of recent progress in quantum computing and quantum algorithms.**Keywords**

1. Quantum Mechanics
2. Quantum Computing
3. Quantum Information Theory
4. Quantum Circuit Model
5. Universal Quantum Gates
6. Quantum Algorithms
7. Quantum Error Correction
8. NISQ Hardware

- 9. Hybrid Algorithms
- 10. Recent Advancements

Learning Prerequisites

Required courses

Quantum Physics, Linear Algebra

Learning Outcomes

By the end of the course, the student must be able to:

- Apply the quantum circuit model
- Design simple quantum algorithms
- Formalize the quantum computing paradigm
- Assess / Evaluate the computational complexity of quantum algorithms
- Analyze the origin and extent of quantum advantage
- Discuss quantum error correction codes
- Explore the recent progress in the field
- Classify quantum algorithms

Teaching methods

Ex cathedra. Lecture notes available. Exercises and hands-on problems using the Qiskit platform

Assessment methods

Oral exam including the presentation of a project selected and carried out during the last weeks of the term

Summary

This course develops the quantum theory of electromagnetic radiation from the principles of quantum electrodynamics. It will cover historic developments (coherent states, squeezed states, quantum theory of spontaneous emission) and moreover modern developments, e.g. quantum noise and circuit QED

Content

- **Quantization of the electromagnetic field**

- Week 1: Quantization of a Harmonic Oscillator, quantization of electrical circuits, field quantization
- Week 2-3: Fock states, coherent states and squeezed states

- **Measuring the quantum States of Light**

- Week 4: Phase space representations (Q-function, Wigner function, P-representation)
- Week 5: Homodyne detection
- Measurements, photon counting
- Photon correlations, HBT effect, $g(2)$ measurements

- **Superconducting circuits**

- Week 6: Josephson Junctions
- Cooper pair box and Transmon
- Circuit quantization

- **Atom field interaction**

- Week 7-8: Light matter interaction, dipole approximation, atom-field interaction Hamiltonian
- Week 9: Quantum optics of an open cavity, Purcell effect
- Cavity QED Hamiltonian
- Week 10: Cavity quantum electrodynamics (cQED): strong coupling, dispersive regime
- Applications of cQED: Generation of arbitrary quantum state of a harmonic oscillator, Quantum Metrology, QND

measurements of TLS

- **Introduction to quantum measurements**

- Week 11: Quantum non-demolition measurements
- Quantum backaction in linear measurements
- Week 12: Quantum limits of interferometric measurements
- Week 13: Ponderomotive Squeezing
- Week 14: Backaction-Evading Measurements
- Quantum theory of an amplifier

- **Other topics covered: Recent developments in quantum optics, and use of Python Quantum Optical Toolbox to simulate open quantum systems**

Learning Prerequisites

Recommended courses

Quantum physics

Learning Outcomes

By the end of the course, the student must be able to:

- Understand the quantum theory of electromagnetic radiation
- Understand the different effects of light-matter interaction
- Understand the differences of classical and quantum properties of light
- Use of Python toolbox to simulate open quantum systems
- Understand modern applications of quantum optics in quantum communication, quantum metrology and quantum computation

Teaching methods

Exercises (weekly).

Assessment methods

written exam

Summary

The goal of the course is to introduce relativistic quantum field theory as the conceptual and mathematical framework describing fundamental interactions.

Content

1. Introduction: Fundamental motivations for quantum field theory, Natural units of measure, Overview on the Standard Model of particle physics.
2. Classical Field Theory: Lagrangian and Hamiltonian formulation.
3. Symmetry Principles: Elements of group theory, Lie groups, Lie Algebras, group representations. The Lorentz and Poincaré groups with their representations on fields. Noether theorem: conserved currents, conserved charges and their role as generators of the group. The conserved charges of the Poincaré group.
4. Canonical quantization of real and complex scalar fields. Creation and annihilation operators. Fock space. Bose statistics. Heisenberg picture field. Realization of symmetries in the quantum theory.
5. Spinorial representations of the Lorentz group. Covariant wave equations and the resulting Weyl, Majorana and Dirac spinors. Plane wave solutions of the Dirac equation. Chirality and helicity. Quantization of the Dirac field. Anticommutation relations and Fermi statistics.
6. Unitary representations of the Poincaré group: Casimir invariants, massive and massless representations.

Learning Prerequisites**Required courses**

Classical Electrodynamics, Quantum Mechanics I and II, Analytical Mechanics, Mathematical Methods

Recommended courses

General Relativity and Quantum Mechanics III warmly recommended.

Learning Outcomes

By the end of the course, the student must be able to:

- Expound the theory and its phenomenological consequences
- Formalize and solve the problems

Transversal skills

- Use a work methodology appropriate to the task.

Teaching methods

3 hours ex-cathedra
2 hours exercises

Assessment methods

Oral exam, based on one theoretical question and one exercise picked through a random choice. The candidate is allowed 1 hour to prepare and 20 minutes to present and discuss the handwritten results.

Remark

.

Summary

The goal of the course is to introduce relativistic quantum field theory as the conceptual and mathematical framework describing fundamental interactions such as Quantum Electrodynamics.

Content

7. Gauge invariance, the electromagnetic field and its coupling to charged fields. Quantized electromagnetic field. Massive vector field. Polarization vectors. Representation of the Lorentz group on single particle states.
8. Causality in classical and quantum field theory
9. Discrete symmetries: parity (P), charge conjugation (C), time reversal (T) and their action of fields and states. CPT theorem.
10. Interacting fields. Formal theory of relativistic scattering. Asymptotic states. Lippmann-Schwinger equation. S-matrix and its symmetries. S-matrix in perturbation theory and Feynman diagrams. Cross sections and decay-rates.
11. Quantum electrodynamics: Feynman rules, elementary processes, Ward identities.
12. The Standard Model: non-abelian gauge theory, the field content and the lagrangian of the SM, the Higgs mechanism.

Learning Prerequisites**Required courses**

Classical Electrodynamics, Quantum Field Theory I, Quantum Mechanics I and II, Analytical Mechanics, Mathematical Physics

Recommended courses

Quantum Mechanics III and IV, General Relativity, Cosmology

Learning Outcomes

By the end of the course, the student must be able to:

- Expound the theory and its phenomenological consequences
- Formalize and solve the problems

Transversal skills

- Use a work methodology appropriate to the task.

Summary

The course builds on QFT1-2 and develops in parallel to The Standard Model course. After briefly revisiting the notions of particle, field and S-matrix, the course fully develops the theory of Renormalization and closes on the quantization of non-abelian gauge theories.

Content

1) Brief foray into "axiomatic" QFT

- Unitary representations of the Poincaré group
- Fields, relativistic wave equations
- Cluster property and LSZ formula for the S-matrix

2) Path Integral approach to QFT

- Functional methods, Effective action
- Equations of motion, Ward identities, Goldstone theorem

3) Renormalization

- loop corrections and regularization methods
- renormalization with examples of its systematics
- applications to QFTs with scalars, fermions and Abelian gauge fields, in particular to Quantum Electrodynamics

4) The renormalization group

- asymptotic freedom and fixed points
- Callan-Symanzik equation
- renormalization of composite operators

5) Quantization of non-abelian gauge theories

- path Integral in gauge theories and Faddeev-Popov method
- ghosts and BRST symmetry
- physical states and unitarity
- Slavnov-Taylor identities and basics of renormalization

5) Infrared divergences (time permitting)

- soft photons and soft gravitons
- Lorentz invariance and current conservation (Weinberg)
- real and virtual emission of soft photons, cancellation of IR divergences

Keywords

Quantum Fields, LSZ Reduction, Renormalization, Renormalization Group, Composite Operators, Fixed Points, Gauge Theories, BRS symmetry

Learning Prerequisites**Required courses**

QFT1, QFT2, QM3, QM4

Recommended courses

General Relativity and Cosmology 1

Learning Outcomes

By the end of the course, the student must be able to:

- Formulate
- Analyze
- Reason
- Model
- Solve
- Illustrate
- Compute
- Demonstrate

Transversal skills

- Use a work methodology appropriate to the task.

Teaching methods

A mix of inverted class, based on recorded lectures from previous years, and of ex cathedra lectures

Expected student activities

Weekly take home exercises, with weekly assessment

Assessment methods

Weekly exercises during the semester: 20% of evaluation

Take home written exam: 30% of evaluation

Oral exam: 50% of evaluation

Resources**Bibliography**

- The Quantum Theory of Fields I and II, Steve Weinberg
- An Introduction to Quantum Field Theory, Peskin-Schroeder

Summary

After recapping the basics of quantum theory from an information theoretic perspective, we will cover more advanced topics in quantum information theory. This includes introducing measures of quantum information, and developing a more advanced understanding quantum states, channels and measurements.

Content**An operational introduction to quantum information theory**

- Classical state spaces, measurements and operations
- The quantum state spaces, quantum measurements and operations
- Multiple qubit systems, reduced states and purifications.

Quantum Measurements

- POVM Measurements
- Naimark's Dilation Theorem
- Distinguishing quantum states
- State tomography
- The measurement problem
- Quantifying shot noise

Quantum channels

- Definition and examples of quantum channels
- Stinespring Dilation Theorem
- Choi representation of channels
- Channel tomography

Measures of information

- Shannon entropy
- Shannon's noiseless coding theorem
- Von Neumann entropy
- Schumacher's quantum noiseless channel coding theorem
- Entropic inequalities
- Matrix distance measures

Entanglement Theory

- Resource theory of entanglement
- Entanglement entropy
- Witnessing entanglement
- The problem of mixed state entanglement

Learning Prerequisites

Required courses

Essential:

Quantum Physics I, Quantum Physics II

Highly beneficial:

Some knowledge of the basics of quantum computing will be assumed. Therefore this course would follow on nicely from Vincenzo Savona's Quantum Computing Course **PHYS-641**. Alternatively, the basic introduction to quantum computing provided in **QUANT-400** would suffice.

It is worth noting that in the first half of the course there will be some overlap with Jean-Philippe Brantut's Quantum Optics and Quantum Information Course PHYS-454. However, the two courses will take different perspectives and so will be complementary.

Learning Outcomes

By the end of the course, the student must be able to:

- Demonstrate an advanced understanding of quantum information theory.

Assessment methods

60% Written exam, 40% assessed homework tasks.

Summary

This lecture describes advanced concepts and applications of quantum optics. It emphasizes the connection with ongoing research, and with the fast growing field of quantum technologies. The topics cover some aspects of quantum information processing, quantum sensing and quantum simulation.

Content**1. Introduction**

Review of two-level systems and harmonic oscillators.

2. Entanglement, decoherence and measurements

Density matrix of bipartite systems, entanglement, entanglement entropy, generalized measurements, system-meter description and POVMs, completely positive maps and Kraus theorem, quantum channels

3. Open quantum systems

Lindblad master equation, fundamental examples: Optical Bloch equations, damped harmonic oscillator. Stochastic Schrödinger equation, quantum state diffusion.

4. Mechanical effects of light and laser cooling

Motional effects on light-matter interactions, Doppler and recoil shifts, semi-classical forces on the two-level atom, Doppler cooling and magneto-optical traps, resolved sideband cooling.

5 - 6. Operation of quantum machines (two topics chosen among)

- Trapped ions quantum logic
- Rydberg quantum logic
- Collective effects in light-matter interactions and quantum metrology
- Digital and analogue quantum simulation

Learning Prerequisites**Required courses**

Quantum Electrodynamics and quantum optics (Fall semester) or equivalent (see prerequisites below).

Important concepts to start the course

Good understanding of the two-level system and the harmonic oscillator in quantum mechanics, unitary transformations, canonical quantization of the electromagnetic field

Learning Outcomes

By the end of the course, the student must be able to:

- Perform calculations relevant to quantum optics
- Explore the scientific literature in quantum optics and quantum information

Transversal skills

- Make an oral presentation.
- Use both general and domain specific IT resources and tools

Teaching methods

Video lectures, tutorials and exercise solved in the class, computer simulations. Mini-conferences with student presentations of research papers.

Assessment methods

Written examination

Quantum physics III

Yazyev Oleg

Cursus	Sem.	Type
Ing.-phys	MA1, MA3	Opt.
Photonics minor	H	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	6
Session	Winter
Semester	Fall
Exam	Oral
Workload	180h
Weeks	14
Hours	5 weekly
Courses	2 weekly
Exercises	3 weekly
Number of positions	

Summary

To introduce several advanced topics in quantum physics, including semiclassical approximation, path integral, scattering theory, and relativistic quantum mechanics

Content

1. Transition from quantum physics to classical mechanics: the coherent states and the Ehrenfest theorem.
2. Semiclassical approximation in quantum mechanics: general form of the semiclassical wave function and matching conditions at turning points.
3. One-dimensional problems in semiclassical approximation: Bohr-Sommerfeld quantisation condition and the Planck formula, tunnelling probability through a potential barrier, lifetime of a metastable state, splitting of the energy levels in a double-well potential.
4. Scattering theory: cross-section, Moller operators and S-matrix, Green's functions and the scattering amplitude, the T-matrix and the Lippmann-Schwinger formula, perturbation theory for amplitudes and the Born approximation, scattering amplitude via stationary scattering states.
5. Relativistic quantum mechanics: the Dirac equation and its non-relativistic limit - the Pauli equation.

Learning Prerequisites**Required courses**

Quantum physics I, II

Learning Outcomes

By the end of the course, the student must be able to:

- Apply semiclassical considerations to solving physics problems
- Solve a number of prototypical problems of quantum physics
- Develop a connection between quantum and classical physics

- Apply scattering theory formalism to solving physics problems

Teaching methods

Ex cathedra and exercises

Assessment methods

oral exam (100%)

Resources**Bibliography**

Summary

Introduction to the path integral formulation of quantum mechanics. Derivation of the perturbation expansion of Green's functions in terms of Feynman diagrams. Several applications will be presented, including non-perturbative effects, such as tunneling and instantons.

Content**I. The Path Integral Approach to Quantum Mechanics**

1. The Feynman Path Integral in Quantum Mechanics
2. Thermal Density Matrix and Imaginary-time Path Integral
3. Propagator of the Quantum Harmonic Oscillator

II. Interaction with an external electromagnetic field

1. Gauge invariance in Quantum Mechanics
2. Particle in a constant magnetic field and Landau levels
3. Path integral for a particle in a vector potential and Aharonov-Bohm effect. Introduction to the geometric phase

III. Correlation functions, functional methods, and Feynman diagrams

1. Path integral for the matrix elements of operators, path roughness and thermal correlation functions
2. Functional methods: Wick's theorem, Feynman-Jensen variational principle and mean-field theory
3. Feynman diagrams: Wick's theorem, linked-cluster theorem, and application to the quartic anharmonic oscillator

IV. The Semiclassical Approximation and Instantons

1. The semiclassical spectrum
2. The semiclassical Van Vleck-Pauli-Morette propagator
3. Instantons in Quantum Mechanics: the gap of the quartic double well

Keywords

Path integral formalism. Green's function. Determinants. Feynman diagram. Feynman rules. Perturbation theory. Non-perturbative effects. Tunnelling. Instantons. Gauge-invariance.

Learning Prerequisites**Required courses**

Analytical Mechanics
Physics III (Electromagnetism)
Quantum Physics I, II

Recommended courses

Quantum Physics III

Important concepts to start the course

Solid knowledge and practice of calculus (complex variable) and linear algebra

Learning Outcomes

By the end of the course, the student must be able to:

- Formulate a quantum mechanical problem in terms of a Path integral
- Compute gaussian path integral as determinants
- Express physical quantities in terms of the Green function
- Translate a Feynman diagram into a mathematical expression
- Compute a Feynman diagram
- Compute tunneling rates in simple quantum potentials
- Formulate the quantum theory of a particle interacting with an external electromagnetic field

Transversal skills

- Use a work methodology appropriate to the task.
- Set objectives and design an action plan to reach those objectives.

Teaching methods

Ex cathedra and exercises

Expected student activities

Participation in lectures. Solving problem sets during exercise hours. Critical study of the material.

Assessment methods

Written exam

Supervision

Office hours	Yes
Assistants	Yes
Forum	Yes

Quantum transport in mesoscopic systems

Banerjee Mitali

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Minor in Quantum Science and Engineering	E	Opt.
Physicien	MA2, MA4	Opt.
Quantum Science and Engineering	MA2, MA4	Opt.

Language of teaching	English
Credits	4
Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course aims to introduce the transport behaviors of micron-size systems, emphasizing learning about recent path-breaking experiments on 2D systems such as Graphene and other van der Waals materials. The course will also introduce the concept of topological protection and strong correlations.

Content

1. Introduction to mesoscopic systems and semi classical transport equation
2. One dimensional ballistic transport -Landauer-Buttiker formalism
3. Topological effects - Integer and Fractional quantum Hall effect
4. Fractionally charged particles and anyonic statistics
5. Chern insulators: Berry's phase, Haldane model and TKNN model
6. Quantum dot: Coulomb blockade and charge transfer
7. Introduction to Graphene: Pseudospin, Hamiltonian, Quantum Hall effect
8. Superconductivity: BCS, BdG Hamiltonian and Topological superconductivity
9. Magic angle twisted graphene: Superconductivity and Correlated states
10. Semiconducting van der Waals materials and strongly correlated phases of matter
11. Introduction to recent significant experimental works
12. Introduction to topological quantum computation

Keywords

Graphene, Topology, string correlation, superconductivity, quantum Hall effects

Learning Prerequisites**Required courses**

Quantum mechanics I and II
Solid state I and II (not mandatory)

Learning Outcomes

By the end of the course, the student must be able to:

- Describe current research in the field of mesoscopic systems and quantum devices
- Use theoretical concepts to describe real quantum systems
- Formulate the challenges in the field of device physics and connect to quantum science and technology

Teaching methods

Lectures with student's participation and hands-on activities.

Expected student activities

Actively participate to all lectures by asking questions. Deliver a final presentation on modern research topic.

Assessment methods

Each student will be presenting one of the proposed papers during a final symposium.

Radiation biology, protection and applications

Damet Jerome, Grilj Veljko, Pakari Oskari Ville

Cursus	Sem.	Type
Ing.-phys	MA1, MA3	Opt.
Nuclear engineering	MA1	Obl.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	4
Session	Winter
Semester	Fall
Exam	Written
Workload	120h
Weeks	14
Hours	3 weekly
Courses	2 weekly
Exercises	1 weekly
Number of positions	

Summary

This is an introductory course in radiation physics that aims at providing students with a foundation in radiation protection and with information about the main applications of radioactive sources/substances in the industry. The course includes presentations, lecture notes and problem sets.

Content

- Radioactivity and interactions of ionising radiation in matter
- Health effects of ionising radiation
- Dosimetry and population exposure
- Space radiation dosimetry
- Operational radiation protection: Sources, Shielding, Calculations
- Internal and external exposure to radionuclides and radiation
- Emergency dosimetry and extreme radiological events
- International nuclear safeguards
- Industrial applications: food irradiation, radioisotope batteries, radiation imaging, etc.
- Applications in research: dosimetry for radiotherapy, metrology, etc.

Learning Outcomes

By the end of the course, the student must be able to:

- Explain the origin of ionising radiation
- Explain interactions of ionising radiation in matter.
- Explain biological/health effects of the ionising radiation
- Explain the principles of dosimetry
- Explain exposure to the general population and cite exposure levels
- Explain the principles of radiation protection, cite the dose limits
- Describe the protection means for external and internal exposure
- Explain the use of radiation in industrial and research applications.
- Design appropriate radiation shielding for a given source or application
- Contextualise extreme radiological events

Assessment methods

Written, Multiple Choice Question exam

Resources**Bibliography**

Handouts will be distributed

Nuclear engineering	MA1	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	4
Session	Winter
Semester	Fall
Exam	Oral
Workload	120h
Weeks	14
Hours	3 weekly
Courses	2 weekly
Exercises	1 weekly
Number of positions	

Summary

The course presents the detection of ionizing radiation in the keV and MeV energy ranges. Physical processes of radiation/matter interaction are introduced. All steps of detection are covered, as well as detectors, instrumentations and measurements methods commonly used in the nuclear field.

Content

- **Interaction of radiation with matter at low energies:** X-rays/gammas, charged particles and neutrons up to MeV range, ionisation, nuclear cross sections.
- **Characteristics and types of detectors:** gas detectors, semiconductor detectors, scintillators and optical fibers, fission chambers, meshed and pixel detectors
- **Signal processing and analysis:** types of electronics, signal collection and amplification, particle discrimination, spatial and time resolution
- **Nuclear instrumentation and measurements:** principle of measurements, spectrometry, common detection instrumentations, applications in nuclear engineering and R&D.

Keywords

radiation detection; radiation-matter interaction; ionizing radiation; detector; signal processing; nuclear instrumentation; measurement methods

Learning Outcomes

By the end of the course, the student must be able to:

- Explain interaction processes of ionising radiation and matter
- Describe the production of a detection signal and its processing
- Explain the operation of all types of commonly used detectors
- Assess / Evaluate the detection system and method required for a specific measurement

Transversal skills

- Communicate effectively with professionals from other disciplines.

Teaching methods

Lectures, exercises, presentations, practice.

Expected student activities

Attendance at lectures and exercises, short presentations.

Assessment methods

Oral exam

Supervision

Assistants Yes

Number of positions	

Summary

Introduce the students to general relativity and its classical tests.

Content

The course will be given on Zoom, the exercises in person

- The equivalence principle
- Introduction to differential geometry
- The Einstein equations and the Einstein-Hilbert action
- Perturbation theory for weak gravitational fields
- Gravitational waves
- The Schwarzschild solution and classical tests of GR
- Black holes

Learning Prerequisites**Required courses**

Analytical mechanics

Classical Electrodynamics

Important concepts to start the course

Special Relativity

Learning Outcomes

By the end of the course, the student must be able to:

- Explain the basic concepts of special and general relativity
- Compute Christoffel symbols and curvatures from a given line element
- Derive the Einstein equations in linear perturbation theory for weak gravitational fields.
- Solve the Einstein equations in linear perturbation theory for weak gravitational fields.
- Explain the basics of gravitational radiation (equation of motion, generation and observation).
- Solve Einstein's field equations for static spherically symmetric problems
- Explain the observational effects at the scale of the Solar System that cannot be described by Newtonian gravity

- Explain the space-time associated to the Schwarzschild black hole.

Teaching methods

The course will be given on Zoom, the exercises in person

Assessment methods

Final written exam

Summary

This course is the basic introduction to modern cosmology. It introduces students to the main concepts and formalism of cosmology, the observational status of Hot Big Bang theory and discusses major physical processes in the early Universe.

Content

- Basic facts about the Universe
- Red shift and Hubble expansion
- Homogeneous spaces and Friedman-Robertson-Walker metric
- Open, closed and spatially flat universe
- Matter dominated and radiation dominated Universe
- Cosmological constant and accelerated universe expansion
- Physical processes in the early Universe and the cosmic microwave background radiation
- Inflationary cosmology

Keywords

1. Expansion of the Universe
2. Hot Big Bang theory
3. Dark matter
4. Accelerated expansion of the Universe
5. Inflation
6. Cosmic Microwave background radiation

Learning Prerequisites**Required courses**

Analytical Mechanics
 Classical Electrodynamics
 Statistical Physics I
 Relativity and Cosmology I

Recommended courses

Quantum Physics III
 Relativistic quantum fields I
 Nuclear and Particle Physics I, II

Learning Outcomes

By the end of the course, the student must be able to:

- Estimate the lifetime of the Universe, knowing the cosmological parameters
- Formulate the main observational evidence for the hot Big Bang theory
- Describe basic cosmological epochs

Transversal skills

- Use a work methodology appropriate to the task.

Teaching methods

Ex cathedra and exercises

Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

This course presents the physical principles and the recent research developments on three topics of particle and nuclear physics: the physics of neutrinos, dark matter, and plasmas of quarks and gluons. An emphasis is given on experimental aspects in these three research fields.

Content

Neutrino physics:

- Neutrino mass measurements, beta and double-beta decay experiments.
- Neutrino mass generation mechanism, Majorana and Dirac particles.
- Neutrino oscillations, MNS matrix.
- Cosmic neutrinos : origin, energy spectrum and detection.

Dark matter:

- Evidence for dark matter from astronomical and cosmological data.
- Relic particles of the "Big bang". Candidates for dark matter, and link with particle physics beyond the Standard Model.
- Direct and indirect searches for dark matter.

Quark gluon plasma (QGP):

- Plasma of quarks and gluons: properties, plasma signatures, production in the collisions of heavy ions.

Learning Prerequisites**Required courses**

Nuclear and particle physics I and II (PHYS-311, PHYS-312)

Recommended courses

Quantum physics I and II (PHYS-313, PHYS-314), Particle physics I (PHYS-415)

Learning Outcomes

By the end of the course, the student must be able to:

- Interpret fundamental results in neutrino, dark matter, and quark and gluon plasma physics

- Identify the physical observables in these three fields of research
- Discuss the experimental principles in these fields
- Assess / Evaluate the experimental methods and results presented in scientific publications
- Estimate the experimental sensitivity of experiments

Teaching methods

Ex cathedra and exercises in the classroom

Assessment methods

oral exam (100%)

Credits	4
Session	Winter
Semester	Fall
Exam	Written
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

Lectures on the fundamental aspects of semiconductor physics and the main properties of the p-n junction that is at the heart of devices like LEDs & laser diodes. The last part deals with light-matter interaction phenomena in bulk semiconductors such as absorption, spontaneous & stimulated emission.

Content**1. Electronic properties of semiconductors**

- Crystalline structures and energy band diagrams: essential features
- Impurities and doping
- Carrier statistics in equilibrium and out-of-equilibrium
- Electron transport in weak and strong fields
- Generation and recombination processes

2. Theory of junctions and interfaces

- p - n and metal-semiconductor junctions at and out of thermal equilibrium
- Heterojunction interfaces

3. Light-matter interaction in semiconductors

- Fermi's golden rule, absorption, optical susceptibility, Bernard-Duraffourg condition (optical gain condition)
- Spontaneous and stimulated emission of radiation
- Dielectric function, optical constants
- Radiative lifetime (2-level system and bulk semiconductors), photoluminescence spectra

Learning Prerequisites**Recommended courses**

Solid State Physics I and II (Bachelor), Quantum Electrodynamics and Quantum Optics (Master)
Quantum physics I and II (Bachelor)

Learning Outcomes

By the end of the course, the student must be able to:

- Explain - the main electronic and optical properties of bulk semiconductors (band structure, doping, absorption,

excitonic features) that are behind the first quantum revolution (transistors, LEDs and laser diodes)

- Identify - the main criteria governing the I-V characteristics of the p-n junction and explain its departure from ideality (role of defects and Joule heating)
- Classify - semiconductors depending on their doping level (non-degenerate vs degenerate semiconductors)
- Compute - the Shockley-Read-Hall term, the bimolecular recombination coefficient and the Auger term entering into the ABC model
- Compute - the absorption spectrum of direct bandgap bulk semiconductors
- Compute - the radiative lifetime of a 2-level system and that of a direct bandgap bulk semiconductor
- Explain - the main properties of tunnel diodes and solar cells

Transversal skills

- Give feedback (critique) in an appropriate fashion.
- Make an oral presentation.
- Demonstrate a capacity for creativity.
- Demonstrate the capacity for critical thinking
- Assess one's own level of skill acquisition, and plan their on-going learning goals.
- Summarize an article or a technical report.

Teaching methods

Ex cathedra with exercises

Expected student activities

Weekly graded homeworks to secure 1 point out of 6 (16.6% of the final grade)

Read the bibliographical resources in order to fully integrate and properly use the physical concepts seen in the lectures and the exercises

Assessment methods

Written exam (with 1 point out of 6 earned via compulsory weekly homeworks (16.6%))

Supervision

Office hours	Yes
Assistants	Yes
Others	Office hours: appointments to be arranged by emails.

Summary

The aim of this course is to provide an introduction to the theory of a few remarkable phenomena of modern condensed matter physics ranging from the quantum Hall effects to superconductivity.

Content**Magnetism of insulators**

- Review of band theory
- Mott insulators and Hubbard model
- Heisenberg model
- Spin-wave theory of ferromagnets and antiferromagnets

Orbital magnetism of metals and semiconductors

- Landau levels
- De Haas-Van Alphen and Shubnikov-de Haas oscillations
- 2D electron gas: Integer and fractional Quantum Hall effects

Theory of superconductivity

- Electron-phonon interaction
- BCS theory
- Landau-Ginsburg theory
- Flux quantization and Josephson effect

Learning Prerequisites**Recommended courses**

Good grasp of quantum mechanics and solid state physics say at the level of "*Lectures on quantum mechanics*" by Gordon Baym and "*Solid state physics*" by Ashcroft and Mermin

Learning Outcomes

By the end of the course, the student must be able to:

- Explore the quantum properties of solids and synthetic many body systems

Transversal skills

- Access and evaluate appropriate sources of information.
- Continue to work through difficulties or initial failure to find optimal solutions.

Teaching methods

Summary

Solid State Physics IV provides a materials and experimental technique oriented introduction to the electronic and magnetic properties of strongly correlated electron systems. Established knowledge is complemented by current research trends, aiming to prepare the students for independent research.

Content**1. Brief Introduction to Scattering and spectroscopic methods**

- Neutron scattering
- X-ray scattering
- Electron scattering
- Angular resolved photoemission and optical spectroscopy
- out of equilibrium experiments

2. Bulk methods

- Transport, specific heat and susceptibility

3. Strongly correlated electron materials

- Transition metal oxides
- Cuprates: high-temperature superconductivity
- manganites: colossal magnetoresistance

4. Introduction to quantum magnetism

- Low-dimensional magnetism
- Rare-earth magnetism
- Quantum phase transitions

Learning Prerequisites**Recommended courses**

Solid state physics I and II or the equivalent to one of the book Ashcroft & Mermin or Kittel

Learning Outcomes

By the end of the course, the student must be able to:

- Decide which experimental technique is suited to investigate a certain phenomenon or property
- Interpret experimental data in the context of phenomena encountered during the course
- Sketch the key electronic and magnetic properties of transition metal material classes

Transversal skills

- Make an oral presentation.
- Summarize an article or a technical report.

Exercises	2 weekly
Number of positions	

Summary

This course will give an overview of the experimental state of the art of quantum technology for Quantum Information Processing (QIP). We will explore some of the most promising approaches for realizing quantum hardware and critically assess each approach's strengths and weaknesses.

Content

We will provide a systematic introduction to experimental realizations of quantum information processing with solid-state systems, with a particular focus on the Superconducting Circuit Quantum Electrodynamics platform. We will explore the fundamentals of qubits, quantum gates, and measurements.

We will also introduce spin qubits defined by electrons and holes confined in a semiconductor environment. We will explain how we can isolate single electrons or holes in semiconducting islands called quantum dots and control them to perform quantum gates.

In addition, we will provide a thorough introduction to other physical implementations pursued in current research for realizing more robust solid-state qubits. We will also analyze hybrid devices implemented combining spin and mechanical degrees of freedom with superconducting technology on the same quantum device.

1. Introduction to Quantum Information Processing

- DiVincenzo criteria and universal quantum computers. Quantum gates, circuit representation. Example of algorithms.

2. Superconducting quantum hardware for quantum computing and QIP

- Understanding the physical concepts underlying superconducting qubits experiments: superconductivity and Josephson effect. Superconducting Quantum Interference Device. Quantization of electrical circuits.

3. Josephson junctions-based circuits.

- Cooper-pair box and Qutrit. Flux and Phase qubit. The transmon (limit) and its use as a quantum bit. Frequency tunability with SQUIDs. Fluxonium.

4. Measurement and Control of Superconducting qubits.

- Interfacing qubits and photons: circuit quantum electrodynamics (cQED). Design and fabrication of superconducting circuits and Experimental Setup for cQED experiments. Dispersive limit and readout of superconducting qubits. Characterizing qubit coherence.

5. Realizations of algorithms and protocols.

- Multiqubit devices: qubit/qubit interaction and entangling gates. Quantum Error Correction

6. Survey of other Physical Implementations for QIP: Electronic and nuclear spins in semiconductor quantum dots.

- Define Quantum Dots and Spin Qubits (Loss-Di Vincenzo, Singlet-Triplet, Exchange only,...) in GaAs, Si and Ge. Spin to Charge conversion readout. Electron spin manipulation. Two Spin qubits gates. Scaling up spin qubits.

7. Survey of other Physical Implementations for QIP: Majorana fermions and Superconducting Protected qubits.

8. Circuit Quantum Electrodynamics with Hybrid Systems.

- Coherent coupling of Superconducting systems to: Charge and Spin system in QDs, small ensembles of spins, mechanical systems. Electrically tunable Transmon (Gatemon).

Keywords

Quantum technology, quantum electrodynamics, quantum computing, quantum simulation, quantum optics, quantum measurement, quantum devices

Learning Prerequisites

Required courses

All students with a general interest in quantum information science, quantum optics, and quantum engineering are welcome to this course.

Basic knowledge of quantum physics and quantum systems concepts, e.g., from courses such as Quantum Physics I and II, or courses on topics such as atomic physics, solid-state physics, is a plus but not a strict requirement for successful participation in this course.

Recommended courses

Quantum Physics I, Quantum Physics II, Quantum Information and Quantum Computing

Important concepts to start the course

Superconductivity. Two-level system and harmonic oscillator in quantum mechanics.

Learning Outcomes

By the end of the course, the student must be able to:

- Develop a basic understanding of the different elements necessary to build superconducting and semiconducting quantum circuits.
- Analyze and understand the scientific literature about the state-of-the-art of solid state quantum technology for quantum information.
- Establish conceptual insight into the operation, opportunities, and challenges of various qubit implementations.
- Work out / Determine the requirements of quantum hardware for quantum computing and quantum information technology.
- Compare various qubit implementations in different solid-state quantum platform.

Teaching methods

Ex-cathedra, exercise classes. Mini-conference with student presentations.

In this course, lectures are combined with homework assignments as well as presentations of recent research papers.

Expected student activities

Weekly problem sheet solving, paper reading and presentation.

Assessment methods

Oral examination

Resources

Bibliography

Reviews and research papers to be studied at home, material presented during lectures.

PHYS-510

Spintronics : basics and applications

Pivetta Marina, Rusponi Stefano

Cursus	Sem.	Type
Ing.-phys	MA2, MA4	Opt.
Physicien	MA2, MA4	Opt.
Physics		Opt.

Language of teaching	English
Credits	4
Session	Summer
Semester	Spring
Exam	Oral
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

Starting from fundamentals of magnetism, the course develops the concepts required to understand and describe reading and writing processes of a magnetic bit. Similarities and differences between classical and quantum systems are addressed.

Content

Spintronics is one of the emerging fields focused on next-generation nanoelectronic devices aiming at reduced power consumption and increased memory and processing capabilities. Such devices use not only the electron charge, as traditional electronics does, but also the electron spin as an additional degree of freedom to boost performance. The course provides the basis necessary to understand and describe spin dynamics in solids and nanostructures. The time evolution of the magnetization under the torque generated by magnetic fields and spin currents is presented. Applications to devices as hard disk drive (HDD) and magnetic random-access memory (MRAM) are discussed. Finally, analogies and differences of spin dynamics in 3D/2D vs 0D (single atom bit) materials are shown.

1) Fundamentals of magnetism

- Magnetic moments (spin and orbital moment, Hund's rules)
- Spin-orbit interaction
- Exchange interactions (Heisenberg exchange, Dzyaloshinskii-Moriya interaction (DMI))
- Crystal field and magnetic anisotropy

2) Spin dynamics in solids and nanostructures

- Magnetization dynamics induced by magnetic fields and temperature
- Continuum approximation: Landau-Lifshitz-Gilbert (LLG) equation and its microscopic origin
- Bit reversal: coherent vs incoherent reversal
- Designing and writing the recording media in HDD

3) Spin transfer torque (STT)

- Giant (GMR) and tunnel (TMR) magnetoresistance, magnetic tunnel junctions (MTJ)
- Writing by means of spin-polarized currents: Landau-Lifshitz-Gilbert-Slonczewski (LLGS) equation
- GMR/TMR for reading heads in HDD, and for MRAM operation

4) Spin orbitronics

- Spin-orbit torque (SOT) at interfaces (Rashba-Edelstein effect, spin-Hall effect (SHE))
- SOT- MTJ vs. STT- MTJ: opportunities and challenges for devices

5) From continuum approximation to quantum dynamics

- Quantum tunneling of magnetization
- Single atom magnets and single ion molecular magnets
- Demagnetization induced by spin-phonon and spin-electron scattering
- Writing and reading single atom magnets with spin-polarized currents: spin polarized scanning tunneling microscopy (SP-STM)
- Single atom magnets as qubit prototypes

Keywords

spin, magnetoresistance, magnetization dynamics, qubits, magnetic anisotropy, exchange

Learning Prerequisites

Recommended courses

Basic knowledge in atomic and solid state physics is helpful

Learning Outcomes

By the end of the course, the student must be able to:

- Formulate the laws describing the macrospin dynamics of a classical magnetic bit
- Formulate the laws describing the spin dynamics of a qubit
- Assess / Evaluate the effect of a spin current on the magnetic state of a bit
- Interpret the results of a scientific experiment

Transversal skills

- Use a work methodology appropriate to the task.
- Demonstrate the capacity for critical thinking
- Summarize an article or a technical report.

Teaching methods

Ex cathedra with exercises in class

Assessment methods

Oral exam

PHYS-475

Statistical physics : theory of phase transitions

De Los Rios Paolo

Cursus	Sem.	Type
Ing.-phys	MA1, MA3	Opt.
Physicien	MA1, MA3	Opt.

Language of teaching	English
Credits	4
Session	Winter
Semester	Fall
Exam	Written
Workload	120h
Weeks	14
Hours	4 weekly
Courses	2 weekly
Exercises	2 weekly
Number of positions	

Summary

Phase transitions are ubiquitous, from the first instants of the universe to living matter. Despite the vast difference in microscopic details, some features of phase transitions are universal and can be explained by the careful use of statistical mechanics, leading up to the renormalisation group.

Content**1: Introduction and Overview**

What is a phase transition?

First-order vs. continuous transitions

Order parameters and broken symmetry

Examples: magnetization, liquid-gas density difference

Notions of criticality and universality

Importance of the thermodynamic limit

2: The Ising Model in 1D

Model definition and transfer matrix solution

Free energy, magnetization, correlation length

No phase transition in 1D with short-range interactions

3: Ising Model in 2D

Phase diagram and symmetry breaking

Numerical and heuristic insights into critical behavior

Notion of long-range order

4: Mean-Field Theory

Variational approach for the Ising model

Critical temperature, spontaneous magnetization

Mean-field critical exponents

Limitations of mean-field theory

5: Correlation Functions, Fluctuations and thermodynamic quantities

Connected correlation functions

Susceptibility and structure factor

Correlation length and scaling near criticality

6: Landau Theory of Continuous Transitions

Free energy expansions in terms of order parameters

Symmetry-based construction

Prediction of second-order behavior and exponents

Role of anisotropy and higher-order terms

7: Ginzburg Criterion and Fluctuations

Ginzburg-Landau field theory
Breakdown of mean-field near lower dimensions
Upper critical dimension
Gaussian approximation

8: Scaling Hypothesis

Homogeneity of the free energy
Scaling forms for thermodynamic observables
Critical exponents and their relations
Widom and hyperscaling relations

9: Renormalization Group (RG): Basics

Coarse-graining and scale transformations
Fixed points, flows, and criticality
Relevant, irrelevant, and marginal operators
Universality classes and dimensionality

10: RG for the Ising Model

Real-space RG: decimation, Migdal-Kadanoff
 ϵ -expansion near 4D
Identification of universality classes

11: First-Order Phase Transitions

Discontinuity in the order parameter
Metastability and nucleation
Maxwell construction
Clausius-Clapeyron relation
Spinodal decomposition and hysteresis

12: Geometrical Critical Phenomena

Percolation: threshold, exponents, mean field-solution, mapping onto Potts models
 $O(n)$ model and the limit $n \rightarrow 0$: self-avoiding walks

Keywords

Phase transitions
Critical exponents
Universality
Renormalisation group

Learning Prerequisites**Required courses**

Basic Statistical Mechanics

Learning Outcomes

By the end of the course, the student must be able to:

- Use mean-field to solve models
- Use computational methods to solve models
- Demonstrate formal derivation
- Identify strengths and weaknesses of different solution methods

- Solve models using the renormalisation group

Assessment methods

Written exam

Remark

pas donné en 2025-26

Summary

This course introduces statistical field theory, and uses concepts related to phase transitions to discuss a variety of complex systems (random walks and polymers, disordered systems, combinatorial optimisation, information theory and error correcting codes).

Content

1. Introduction to statistical field theory
2. Random walks and self-avoiding polymers
3. Percolation, Networks
4. Information theory and error correcting codes
5. Disordered systems (spin glasses) and combinatorial complexity

Learning Prerequisites**Recommended courses**

Statistical Physics II

Learning Outcomes

By the end of the course, the student must be able to:

- Solve problems in complex systems

Transversal skills

- Assess one's own level of skill acquisition, and plan their on-going learning goals.

Teaching methods

Ex cathedra. Exercises in class

Assessment methods

written exam

Number of positions	

Summary

Noise and fluctuations play a crucial role in science and technology. This course treats stochastic methods, applying them to both classical problems and quantum systems. It emphasizes the frameworks of fluctuation-dissipation theorems, stochastic differential equations, and Markov processes.

Content**I****I. Introduction to classical non-equilibrium thermodynamics**

- Brownian Motion and Einstein relation
- Stochastic differential equation, Ito calculus and Fokker Planck equations
- Anomalous Diffusion, Levy Flights
- Metastability and Kramers escape rate problems
- Mesoscopic Master equation

II. Statistical Mechanics of Linear Response

- Kubo Formula
- Fluctuation Dissipation Theorem
- Markovian Processes
- Non-equilibrium Fluctuation theorems: Jarzinsky and Crook equality
- Metropolis Hastings algorithm for simulation of state space

III. Open Quantum Systems: stochastic methods in Quantum Optics

- The quantum Master equation and open quantum systems
- The damped quantum mechanical harmonic oscillator
- Two level system in a heat bath, de-phasing processes.
- Quantum stochastic Langevin equations
- Quantum optical master equation and numerical methods of solution (QuTip Python)
- Classical versus Quantum mechanical spectral densities

IV. Special topic (1 Week): Probabilistic data analysis. Metropolis Hastings / Monte Carlo Markov Chains Algorithm in Bayesian Statistical Analysis

- Applications of Markov Chain Monte Carlo (MCMC) to Bayesian Statistical analysis (using the EMCEE Python package). This has proven useful in too many research applications of which the Wilkinson Microwave Anisotropy

Probe (WMAP) cosmology mission provide a dramatic example.

Additional Learning outcomes:

- program Jupyter notebooks based on Python to simulated Brownian motion, escape rate problems, etc.
- Utilize QuTip (quantum optical toolbox)
- Use EMCEE Monte Carlo Markov Chain for for Stat. Data analysis

Learning Prerequisites

Required courses

Quantum Optics advantageous

Recommended courses

Statistical physics I, II, III
Quantum Optics

Learning Outcomes

By the end of the course, the student must be able to:

- Formulate correct mathematical models of statistical processes
- Solve succesfully the quantum master equation using QuTip in Python
- Apply numerical simulation tools to non-equilibrium systems
- Explore the quantum optical numerical Toolbox (MATLAB)
- Visualize non-equilibrium processes numerically using Jupyter Notebooks
- Elaborate modern examples from Literature of Non-Equilibrium Processes
- Apply EMCEE Python package to Bayesian statistical data analysis

Transversal skills

- Make an oral presentation.
- Summarize an article or a technical report.
- Take feedback (critique) and respond in an appropriate manner.
- Use both general and domain specific IT resources and tools

Teaching methods

The teaching approach combines classical blackboard lectures and homework exercises with modern active learning techniques: topical research paper presentations and numerical simulations of the studied equations. In addition, we provide video recordings and summary slides for each lecture.

Expected student activities

Weekly graded homeworks for an extra point.

Assessment methods

Written exam (plus extra points via weekly homeworks)

Supervision

Assistants Yes

Summary

Biological macromolecules such as DNA, RNA, proteins and cytoskeletal filaments are polymers. As such, they share a set of properties that are common to any polymer, which are the focus of this course. Details about the protein folding problem will be covered in the last part.

Content

- 1. Introduction to polymer theory:** on and off-lattice polymers; statistical properties; exact, numerical and approximate results; correlation length; self-avoidance.
- 2. Interacting polymers:** experiments and models; analytical and numerical solutions of the models; phase diagram.
- 3. Proteins:** their role in biology; basic components; experimental results; models; analytical and numerical results. Key questions: evolution.
- 4. Folding proteins by co-evolution:** how comparative genomics has inspired physics models that in turn have inspired AlphaFold.
- 5. Protein folding in the cell:** the protein homeostasis network of the cell.

Learning Outcomes

By the end of the course, the student must be able to:

- Model biological polymers.
- Prove exact results
- Reason by the numbers

Assessment methods

oral exam

Resources**Notes/Handbook**

Handwritten notes.

Summary

The students understand tools from the statistical physics of disordered systems, and apply them to study computational and statistical problems in graph theory, discrete optimisation, inference and machine learning.

Content

Interest in the methods and concepts of statistical physics is rapidly growing in fields as diverse as theoretical computer science, probability theory, machine learning, discrete mathematics, optimization, signal processing and others. Large part of the related work has relied on the use of message-passing algorithms and their connection to the statistical physics of glasses and spin glasses.

This course covers this active interdisciplinary research landscape. Specifically, we will review the statistical physics approach to problems ranging from graph theory (e.g. community detection) to discrete optimization and constraint satisfaction (e.g. satisfiability or coloring) and to inference and machine learning problems (learning in neural networks, clustering of data and of networks, compressed sensing or sparse linear regression, low-rank matrix factorization).

We will expose theoretical methods of analysis (replica, cavity, ...) algorithms (message passing, spectral methods, etc), discuss concrete applications, highlight rigorous justifications as well as present the connection to the physics of glassy and disordered systems.

This is an advanced theoretical course that is designed for students with background in mathematics, electrical engineering, computer science or physics. This course exposes advanced theoretical concepts and methods, with exercises in the analytical methods and usage of the related algorithms.

Learning Prerequisites**Important concepts to start the course**

For physics students Statistical physics I and II (or equivalent) is required.

This lecture is accessible to students in mathematics, electrical engineering, computer science without any previous training in statistical physics. Those students are expected to have strong interest in theory, probabilistic approaches to analysis of algorithms, high-dimensional statistics or probabilistic signal processing.

Learning Outcomes

By the end of the course, the student must be able to:

- Analyze theoretically a range of problems in computer science and learning.
- Derive algorithms for a range of computational problems using technics stemming from statistical physics.

Teaching methods

2h of lecture + 2h of exercise

Assessment methods

Final written exam counting for 70% and midterm written test during the semester counting for the other 30%.

Summary

The goal of this course is to explain the conceptual and mathematical bases of the Standard Model of fundamental interactions and to illustrate in detail its phenomenological consequences.

Content

- Non-abelian gauge theories
- Higgs mechanism and massive gauge theories
- Quarks and Leptons
- Basic electroweak phenomenology
- The flavour structure: quark masses and mixing
- Strong interactions
- Basic flavour phenomenology
- The Standard Model as an Effective Field Theory

Keywords

fundamental interactions, particle phenomenology, gauge theories, Higgs mechanism

Learning Prerequisites**Required courses**

Relativistic Quantum Fields I et II, Advanced Quantum Mechanics, Advanced Quantum Field Theory

Recommended courses

General Relativity, Cosmology

Expected student activities

Appreciate the conceptual foundations of the Standard Model as a theory of fundamental interactions and quantitatively understand its phenomenological success. Be able to concretely apply the Standard Model theory to the prediction of physical processes.

Assessment methods

The course will have a final oral exam (80% of the final grade). Weekly exercises will complement the evaluation (20%)

Supervision

Office hours	Yes
Assistants	Yes

Summary

This course provides exposure to research in biophysics and physical biology, with emphasis on the nature of scientific breakthroughs, and using critical reading of scientific literature. Each week, we will discuss the research of one recipient of the Max Delbruck Prize in Biological Physics.

Content

What constitutes a scientific breakthrough? An outstanding contribution to a scientific field? We will examine these questions by delving into the research of several recipients of the Max Delbruck Prize in Biological Physics, awarded bi-annually/annually by the American Physical Society. Course materials include video lectures by the prize recipients, as well as scientific literature. Students will have the opportunity to analyze, synthesize, and present synopses of chosen areas in Biological Physics.

Learning Outcomes

By the end of the course, the student must be able to:

- Discuss
- Reason
- Argue
- Present
- Synthesize
- Analyze

Transversal skills

- Access and evaluate appropriate sources of information.
- Make an oral presentation.
- Summarize an article or a technical report.
- Write a literature review which assesses the state of the art.

Assessment methods

Continuous assessment includes oral and written contributions from students.

PHYS-597

Travail de spécialisation pour master en physique

Profs divers *

Cursus	Sem.	Type
Physicien	MA1, MA2, MA3, MA4	Opt.

Langue d'enseignement	français / anglais
Crédits	30
Session	Hiver, Été
Semestre	Automne
Examen	Pendant le semestre
Charge	900h
Semaines	
Heures	680 hebdo
Projet	680 hebdo
Nombre de places	

Remarque

Durée du travail de spécialisation interne : un semestre - Durée du travail de spécialisation externe: min. 4 mois, max. 6 mois / Duration of a internal specialisation semester (EPFL): one semester. E

Résumé

Students have the opportunity to apply their knowledge in a project contributing to specialize them in a physics field. The project can take place in a laboratory at EPFL, in an external laboratory or in a research institute.

Contenu

Students develop a physics-related project that allows them to acquire new knowledge and practical experience in a specific field under the supervision of a professor from Physics section. The person in charge of the work may ask the student to obtain specific training.

Doctoral courses could be required for some labs. Information here:

<https://epfl.ch/schools/sb/sph/en/master/master-in-physics/specialization-semester>

Credits for the specialization semester are awarded based on the evaluation of the specialization work. There are no credits assigned for courses taken in the specialization semester.

Acquis de formation

A la fin de ce cours l'étudiant doit être capable de:

- Développer un problème de physique complexe
- Défendre une solution
- Synthétiser la démarche pour solutionner le problème
- Modéliser un système ou un processus
- Appliquer des compétences à un concept ou une solution technique

Compétences transversales

- Comparer l'état des réalisations avec le plan et l'adapter en conséquence.
- Être conscient et respecter les règles de l'institution dans laquelle vous travaillez.
- Gérer ses priorités.
- Écrire un rapport scientifique ou technique.
- Communiquer efficacement et être compris y compris par des personnes de langues et cultures différentes.
- Recueillir des données.
- Accéder aux sources d'informations appropriées et les évaluer.

Méthode d'évaluation

Written report and oral presentation to relevant staff and to the supervisor.
