

# Green Labs Handbook

A practical guide for EPFL SV scientists looking to conduct research in a more sustainable manner.

The purpose of this document is to suggest feasible and impactful actions to limit the environmental footprint of SV labs. The Green Labs Handbook was developed by the <u>Sustainability Office of the EPFL School of Life Sciences</u>, with the help of a consultation committee. It was first developed in 2021 and undergoes a yearly update.

for all lab members

### 1/ Consumables

Consumables (including single use plastics, chemicals and biological products) are a major source of environmental impacts in the lab, especially during their production and disposal stages.

- → **Design your experiment** by brainstorming with your colleagues about how to generate the least waste as possible and favor material reuse or recycling.
- → Borrow products from other labs when you only need a small quantity. Before buying a new product, check its availability in other labs through Catalyse¹ and contact the owner.
- → Use hazardous waste bins exclusively for contaminated waste. This serves to avoid non-contaminated waste undergoing unnecessary energy-intensive end-of-life processing. Follow <u>SV</u> and <u>EPFL</u> waste guidelines.
- → Sort your non-contaminated recyclable waste properly (aluminum, paper, glass...) and bring them to the <u>SV</u> or <u>Al</u> recycling points, or dispose them in the outside containers.

# 2/ Lab equipment

- → Shut down equipment as often as possible to save electricity. Avoid leaving devices on stand-by mode when possible.
- → Contact the SV Workshop as soon as lab equipment presents failures or malfunctions.

## Cooling devices

Cooling devices are a major source of electricity consumption in a lab, especially -80°C freezers (each of them consumes as much energy as an average household²).

- → Optimize sample preservation temperatures to be as close to room temperature as possible. For example, increase PCR end-of-cycle temperature to 15°C (rather than operating 4°C overnight incubations).
- → Optimize freezer space and turn off unused fridges. Readable sample labels and an annual fridge cleanout can help save significant amounts of energy. In addition, try to anticipate what will happen with the samples of anyone leaving the lab.
- → Open freezer doors as rarely as possible. Organize and post a freezer map or inventory on each freezer door so you can locate your sample before opening the freezer. If the

<sup>&</sup>lt;sup>1</sup> Catalyse > type the name of the product > click on "√... ▲ Labs" on the left

doors are not tightly shut (e.g. due to excessive frost accumulation), contact the SV Workshop quickly.

## IT equipment

Most of the environmental impact of IT equipment happens at the manufacturing stage<sup>3</sup>.

- → Avoid replacing IT equipment that is still in good condition.
- → Avoid purchasing multiple screens if not strictly necessary.
- → Use SCITAS services for your computation needs (rather than private servers).
- → Organize an annual cleanout of large files that have become obsolete.

### Biological and chemical extraction hoods

→ Lower the sash of fume hoods all the way down between each use<sup>4</sup>.

#### 1/ Consumables

- → Centralize purchase requests to minimize transportation and packaging needs.
- → Keep a chemical and biological inventory (e.g. through SLIMS) and a proper labelling to avoid product expiry and unnecessary purchases.
- → Consider referring to the ACT environmental impact factor label. It can be a starting point to compare the environmental impact of similar products.

## 2/ Lab equipment

- → Before ordering new equipment:
  - o Consider sharing equipment with other labs and core facilities.
  - Contact the <u>SV Workshop</u> to investigate the availability of free refurbished equipment.
  - Check the SESAME equipment exchange platform<sup>5</sup>.
  - Take advantage of the expertise provided by the SV Workshop team once you decide to buy a new standard piece of equipment. They can help you choose the best option.
- → Contact the SV Workshop whenever lab equipment is not in use anymore.
- → Contact SV IT whenever IT equipment is not in use anymore.
- → Consider increasing the temperature of -80 freezers to -75°C or -70°C with the support of the SV Workshop. This decreases their electricity consumption by up to 30%6. Be aware that this decreases the time you have available in case of a power outage or machine breakdown.

And do not hesitate to **contact us** at sustainability.sv@epfl.ch (5)
